

Principes de traitement des infections à bactéries intracellulaires

Pr Elisabeth Botelho-Nevers

GIMAP (Campus Santé Innovations, UJM, UDL), CIRI
Service d'Infectiologie (CHU de Saint-Etienne)
Inserm CIC 1408- Axe Vaccinologie, I-Reivac, COVIREIVAC
Présage (Institut de prévention en santé globale)

Plan

- Antibiotiques intracellulaires
- Principes de traitement des infections intracellulaires: *C. burnetii*, *Bartonella spp*, *Rickettsia spp*, *S. aureus*!

Plan

- Antibiotiques intracellulaires
- Principes de traitement des infections intracellulaires: *C. burnetii*, *Bartonella spp*, *Rickettsia spp*, *S. aureus*!

Action intracellulaire des antibiotiques?

- Traitement des infections à bactéries intracellulaires strictes (obligatoires): *Coxiella burnetii*, *Rickettsia spp*, *Chlamydia spp*, *Ehrlichia spp*, *Anaplasma spp*, *Tropheryma whipplei*, *Mycobacterium spp*
- Traitement des infections à bactéries intracellulaires facultatives:
 - Les vraies: *Legionella spp*, *Mycoplasma spp*, *Bartonella spp*, *Francisella tularensis*, *Listeria monocytogenes*, *Samonella spp*, *Yersinia spp*, *Brucella*
 - Les « occasionnelles »: *Staphylococcus aureus*, *Pseudomonas aeruginosa*, *Escherichia coli*, *Streptococcus pyogenes*

Cellules cibles

Souvent des macrophages... mais pas que

Main disease-causing intracellular bacteria and their preferential target cells.

Bacterial pathogen	Associated disease(s)	Target cells	Reference(s)
<i>Mycobacterium tuberculosis</i>	Tuberculosis	Macrophages, hepatocytes	[13,14]
<i>Mycobacterium avium</i> complex	Pulmonary infections	Alveolar macrophages	[15]
<i>Mycobacterium leprae</i>	Leprosy	Macrophages, epithelial cells	[16]
<i>Listeria monocytogenes</i>	Listeriosis, meningitis, septicaemia	Macrophages, hepatocytes, enterocytes	[17,18]
<i>Staphylococcus aureus</i>	Pneumonia, mastitis, phlebitis, endocarditis, nosocomial infections, urinary tract infections, osteomyelitis	Macrophages, polymorphonuclear neutrophils	[19]
<i>Salmonella</i> spp.	Salmonellosis, typhoid fever	Macrophages, enterocytes	[20,21]
<i>Brucella</i> spp.	Brucellosis	Macrophages	[22]
<i>Yersinia pestis</i>	Plague	Macrophages	[23]
<i>Escherichia coli</i>	Diarrhoeal illness, urinary tract infections, meningitis in neonates	Epithelial cells, macrophages	[24,25]
<i>Pseudomonas aeruginosa</i>	Pneumonia, endocarditis, meningitis, nosocomial infection	Macrophages, epithelial cells	[26,27]
<i>Legionella pneumophila</i>	Pneumonia	Macrophages	[28]

Cellules cibles

- Les cellules cibles sont variables selon l'infection:
 - **Hématies:** *Bartonella spp*
 - **Monocytes-Macrophages:** *C. burnetii*, *Ehrlichia spp*, *L. monocyctogenes*, *Legionella spp*, *Brucella spp*, *F. tularensis*, *Yersinia*, *Salmonella*, *S. aureus*, *Mycobacterium tuberculosis*....
 - **Cellules endothéliales:** *Rickettsia spp.*, *Bartonella spp.*,
 - **Cellules épithéliales:** *Chlamydia spp*, *S. aureus*, *E. coli*
 - **Ostéoblastes:** *S. aureus*....

pH

Table 1

Main intracellular bacteria with predominant target cells in humans and known subcellular localization of virulent forms

Organism	Type of parasite	Target cells	Subcellular localization	References
<i>Brucella</i> spp	Facultative	Macrophages	Phagosomes	[99]
<i>Chlamydia</i> spp	Obligate	Lung parenchyma cells	Inclusions	[100]
<i>Coxiella burnetii</i>	Obligate	Macrophages, lung parenchyma cells	Phagosomes, phagolysosomes	[101,102]
<i>Francisella tularensis</i>	Facultative	Macrophages	Phagosomes	[103]
<i>Legionella pneumophila</i>	Facultative	Macrophages	Endoplasmic reticulum, lysosomes	[102,104]
<i>Listeria monocytogenes</i>	Facultative	Macrophages, hepatocytes	Cytosol	[4]
<i>Mycobacterium tuberculosis</i>	Facultative	Macrophages	Early endosomes	[105]
<i>Rickettsia</i> spp	Obligate	Endothelial cells	Cytosol	[106]
<i>Salmonella</i> spp	Facultative	Macrophages	Phagosomes	[107]
<i>Shigella flexneri</i>	Facultative	Macrophages	Cytosol	[108]
<i>Staphylococcus aureus</i>	Opportunist	Macrophages, PMNs	Phagolysosomes	[109–111]

Cibles cellulaires

Survival and Intracellular location of bacteria

Escape phagosome live in the cytosol
Listeria spp
Shigella spp
Rickettsia spp

Adapt in acidic environment and live in the phagolysosome

C burnetii
Y pestis
S aureus
Y pseudotuberculosis

Inhibits fusion and live in the phagosome

Chlamydia spp
Ehrlichia
Legionella spp
Y enterocolitica
Brucella spp
F. Tularensis
Salmonella

Les bactéries vont se localiser dans des compartiments cellulaires différents

« Pour vivre heureux, vivons cachés »

- Localisation intracellulaire:
 - évasion immune, protège la bactérie du système immunitaire
 - «Réservoir », infection chronique, rechutes
 - va permettre la dissémination de la bactérie dans les tissus, à distance (PNN, macrophages): «Cheval de Troie »
 - Protège de l'action des ATB

Challenges des antibiotiques en intracellulaire

- I. **Pénétration** de l'ATB en intracellulaire (phagocytes professionnels ou non professionnels)

Entrée dans la cellule

- Les molécules de petite taille (< 700 Da), lipophiles telles que les β lactamines, macrolides et quinolones rentrent par diffusion à travers la membrane lipidique
- L'entrée peut se faire par endocytose si la molécule est plus grande ou ne peut pas diffuser.
- L'endocytose nécessite une internalisation avec des vésicules à la membranes et une invagination de celle-ci. Les vésicules sont diriger vers l'endosome. (Ex: aminosides, via la megaline (recepteur sur endosomes notamment au niveau tubule renal: d'où possible toxicité)
- Une fois dans la cellule les ATB doivent être retenus et s'accumuler à une concentration suffisante pendant une période suffisante.
- Des pompes à efflux vont pouvoir faire sortir les ATB (ex macrolides ou FQ)
- En fonction un ATB peut être bactéricide ou pas en intracellulaire (ex: tigecycline= bactériostatique sur *S. aureus* en intracellulaire et bactéricide sur Salmonella)

Challenges des antibiotiques en intracellulaire

- I. **Pénétration** de l'ATB en intracellulaire (phagocytes professionnels ou non professionnels)
- II. **Stabilité/ Maintien** de l'ATB dans le compartiment intracellulaire
- III. **Hautes concentrations** d'ATB dans le compartiment intracellulaire
- IV. **Bonne localisation**, au contact du pathogène dans la cellule (être dans le bon compartiment)
- V. **Etre actif** sur bactérie en phase de multiplication et quiescente (ex: SCV *S. aureus* etc...)

FACTORS AFFECTING THE ACTIVITY OF ANTIMICROBIALS AGAINST INTRACELLULAR BACTERIA

D_e = extracellular drug
 D_i = intracellular drug

D^* = metabolites
 ● = bacteria

Pharmacokinetic parameters

- ① Penetration and retention
- ② Accumulation
- ③ Subcellular disposition and bioavailability
- ④ Metabolisation and inactivation

Pharmacodynamic parameters

- ⑤ Expression of activity
- ⑥ Bacterial responsiveness

Figure 1: Pharmacokinetic and pharmacodynamic parameters involved in the activity of antimicrobial drugs against intracellular microorganisms.

Challenges des antibiotiques en intracellulaire

VI. Certaines bactéries sont intracellulaires

« facultatives » voire « opportunistes »: survie intra ET extracellulaire

- Donc ATB doivent **aussi** avoir une activité extracellulaire (concentrations)

Table IV. Predictive activity of an antibacterial agent against *Staphylococcus aureus* on the basis of the intracellular and extracellular concentration to minimum inhibitory concentration (MIC) ratios after the addition of 1 and 4 times the minimum bactericidal concentration of the drug to the culture

Antibacterial agent	Intracellular concentration (IC) [mg/L] ^a	MIC (mg/L) ^b	IC : MIC ratio	Extracellular concentration (EC) [mg/L] ^a	EC : MIC ratio
Azithromycin	0.42	0.25	1.68	Not detected	0
	1.78		7.12	0.23	0.92
Azithromycin	0.42	1.0	0.42	Not detected	0
	1.78		1.78	0.23	0.23
Azithromycin ratio range			0.42-7.12		0-0.92 <1
Clarithromycin	0.34	0.12	2.83	0.15	1.93
	1.33		11.08	0.66	5.50
Clarithromycin	0.34	0.50	0.68	0.15	0.30
	1.33		2.66	0.66	1.32
Clarithromycin ratio range			0.68-11.08		0.30-5.50

a Data from Scaglione et al.^[25] represent the resulting concentrations after addition of 1- and 4-times the minimum bactericidal concentration of drug.

b MIC data from the National Committee for Clinical Laboratory Standards.^[17] The upper and lower limit of the range for MIC inhibitory to 90% of organisms were used to determine the intracellular and extracellular concentration to MIC ratios.

Ratios intra/extracellulaire

- Variables selon les antibiotiques/ même famille
- Variables selon le compartiment cellulaire
- Variables selon le pH
- Variables selon la T°
- Variables selon que la cellule est ou non infectée

Table III. Intracellular to extracellular concentration ratio (I/E ratio) for various antibacterial agents, including actual intracellular or extracellular concentrations (when available) for polymorphonuclear leucocytes and macrophages

Antibacterial agent	Assay type	Intracellular concentration (mg/L)	Extracellular concentration (mg/L)	I/E ratio	Reference
Polymorphonuclear leucocytes (PMNs)					
<i>Human-PMNs</i>					
Clindamycin	Radiolabelled		10	11.08	18
Erythromycin	Radiolabelled		18.4	13.32

- Bactéries

Rickettsia spp, *Shigella spp*, *Listeria spp*

Objectif: co-localisation ATB et bactérie

- **Phagosome**

- ATB ?

- Bactéries

- Chlamydia spp, Ehrlichia spp, Legionella spp, Y. enterocolitica, Brucella spp.*

Visualisation de la co-localisation

Figure 3

Intracellular localization and bactericidal activities of nadifloxacin and PHMB against intracellular MRSA. (A) Colocalization of PHMB-FITC with epidemic methicillin-resistant *S. aureus* (EMRSA)-15 in keratinocytes. Keratinocytes were infected with EMRSA-15 followed by treatment with PHMB-FITC (green). Keratinocytes were labelled with DAPI (blue) for keratinocytes and EMRSA-15 nuclei staining and wheat germ agglutination (WGA) (red) for keratinocyte membrane stain. Upper panels are images of infected cells and merged images. Lower panels are enlarged images that clearly show colocalization between PHMB-FITC (green) and EMRSA-15 (blue). White scale bar is 25 μ m. (B) Survival of EMRSA-15 within keratinocytes after treatment with nadifloxacin and PHMB. Keratinocytes infected with strains of EMRSA-15 were either untreated or treated with

Amélioration de la délivrance intracellulaire

N. Abed, P. Couvreur / *International Journal of Antimicrobial Agents* 43 (2014) 485–496

Fig. 1. Intracellular delivery of antibiotics to treat intracellular infections. Following cell internalisation through one or several endocytic pathways, nanocarriers should be destabilised and/or degraded by hydrolytic enzymes and/or acidic pH to allow the antibiotic to be released. A diffusible antibiotic will easily escape from endosomes and reach cytoplasmic bacteria (a) or vesicles containing bacteria (b) to exert antimicrobial activity. In some cases, fusion between endosomes (with captured nanocarriers + antibiotic) and vesicles containing bacteria (c) are needed in order to allow non-diffusible antibiotics to exert their antimicrobial activity.

Targeting the hard to reach: challenges and novel strategies in the treatment of intracellular bacterial infections

Diagnostic de ces infections

- Indirect++
- Direct:
 - Culture: rare
 - Biologie moléculaire+++

Tableau 1. Approche diagnostique de certaines bactéries intracellulaires abordées dans cette revue

[†] Les anticorps de phase II (IgG \geq 1 : 200 UI/ml; IgM \geq 1 : 50 UI/ml) définissent la fièvre Q aiguë, les anticorps de phase I (IgG \geq 1 : 800 UI/ml) définissent la fièvre Q chronique. TB: tuberculose.

Bactérie	Culture	Sérologie	PCR	Autres
<i>M. tuberculosis</i> et autres mycobactéries	<ul style="list-style-type: none"> • Recommandée dans tous les cas (test de référence) • Indispensable pour la détermination du profil de sensibilité antibiotique 	Non disponible	Test commercialisé pour <i>M. tuberculosis</i> . Très utile pour le diagnostic précoce (TB pulmonaire ou méningite) en complément de l'examen direct	<ul style="list-style-type: none"> • Examen direct: très utile pour le diagnostic précoce, mais sensibilité limitée • Interferon-γ release assays (QuantiFERON-TB, T-SPOT.TB): non recommandé pour la TB active (TB latente uniquement)
<i>Legionella</i> spp.	<ul style="list-style-type: none"> • Recommandée pour la pneumonie (milieu spécial) • Très faible rendement dans les échantillons non respiratoires (hémocultures notamment) 	<ul style="list-style-type: none"> • Peu utile pour la forme classique (pneumonie) • A considérer pour des formes atypiques (endocardite) 	Utile (si disponible) en complément de la culture sur les échantillons respiratoires ou autres	<ul style="list-style-type: none"> • Antigène urinaire: recommandé (ne remplace cependant pas la culture, sensibilité limitée, détecte uniquement <i>L. pneumophila</i> séro groupe 1) • Immunofluorescence directe: peu utile (peu sensible)
<i>Chlamydia pneumoniae</i>	Non effectuée de routine	Peu utile en raison du délai pour le diagnostic	Test de choix (rapide et sensible)	–
<i>Mycoplasma pneumoniae</i>	Non effectuée de routine	Peu utile en raison du délai pour le diagnostic	Test de choix (rapide et sensible)	–
<i>Coxiella burnetii</i>	Non effectuée de routine	<ul style="list-style-type: none"> • Recommandée (à répéter à un intervalle de 14 jours si négatif)[†] • Aussi utile pour le suivi 	Utile, en complément de la sérologie	–
<i>Bartonella</i> spp.	<ul style="list-style-type: none"> • Test de référence pour la bactériémie chronique (<i>B. quintana</i>) • Peu utile dans les autres cas (peu sensible, incubation prolongée) 	Test de référence. Bonne sensibilité pour la maladie des griffes du chat et l'endocardite	Utile, en complément de la sérologie (endocardite notamment)	–
<i>Tropheryma whipplei</i>	Non effectuée de routine	Non disponible (taux d'anticorps faibles ou absents)	Recommandée. Sur échantillons de selles et salive (\pm biopsie cutanée et autres sites selon la présentation clinique)	<ul style="list-style-type: none"> • Histopathologie (coloration PAS): pour la forme digestive classique • Immunohistochimie: sur échantillons ciblés

Etude de la sensibilité aux « ATB » en intracellulaire

- Complexe
- Fait souvent appel à la culture
- Pas en routine
- « time consuming »
- Techniques ATBgramme différentes

Bactéries intracellulaires strictes

Plaque assay

Dye uptake assay

Uninfected cells OD = 1
 Infected cells 2000 PFU OD = 0
 Infected cells 200 PFU OD = 0.150
 Infected cells 20 PFU OD = 0.700

•The optical density at 492 nm of each well is determined using a spectrophotometer

The MIC corresponds to the lowest antibiotic concentration for which the mean OD at 492 nm is higher than that of the 20 PFU controls

Doxycycline 0.015 $\mu\text{g/ml}$

Doxycycline 0.03 $\mu\text{g/ml}$

Doxycycline 0.06 $\mu\text{g/ml}$

Doxycycline 0.125 $\mu\text{g/ml}$

Doxycycline 0.25 $\mu\text{g/ml}$

Doxycycline 0.5 $\mu\text{g/ml}$

The MICs are defined as the lowest antibiotic concentration allowing complete inhibition of plaque formation, as compared to a drug-free control

Figure 3. Two examples of informatics tools recently developed to measure the number and/or the size of the lytic plaque. (A) To study the effect of statins on *Rickettsia conorii*-infected cells, an image of the Petri dish was acquired with a photo scanner after staining with crystal violet, and the images were analyzed with the Image J software (MD, USA) using the 'local threshold' algorithm. This software counts and evaluates the size of the plaques in each Petri dish [7]. **(B)** To study the deleterious effects of antibiotics on *R. conorii*-infected cells, the lytic area was measured with the Image J software to more precisely determine the area of each individual lytic plaque (mm^2) by tracing the outline of each plaque [8,10]. The arrow in the centre image shows determination of the scale bar (number of pixels/mm).

Bacteriocidal assay: results

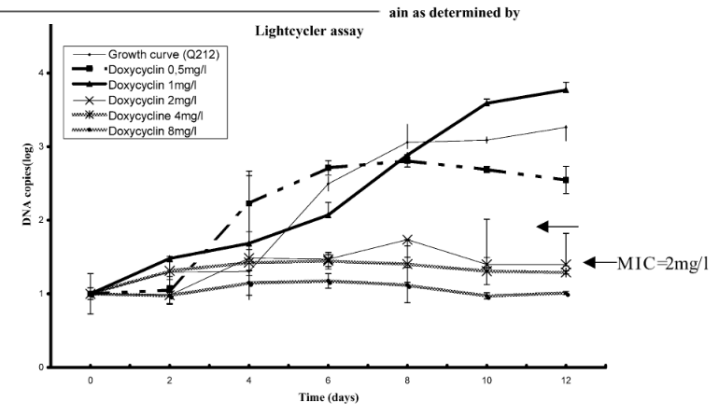

Bacteriocidal activity was deduced from the reduction of the Vacuole Forming Unit (VFU) in cultures receiving antibiotics as compared with drug-free controls

Utilisation de la PCR en temps réel

Table 1
Comparison of the antibiotic MICs for two strains of *C. burnetii* (Q212 and Nine Mile strains), using real time PCR and immunofluorescence assay

Antibiotics susceptibility	Q212, using real time PCR (mg/l)	Q212 using IF (mg/l)	Nine Mile, using real time PCR (mg/l)	Nine Mile, using IF (mg/l)	Previous reports using IFA

Médecine et
maladies infectieuses

General review

Q fever in the Netherlands – 2007–2010: What we learned from the largest outbreak ever

Fièvre Q aux Pays-Bas – 2007–2010 : les enseignements d'une épidémie d'une ampleur sans précédent

P.M. Schneeberger^a, C. Wintenberger^{b,*}, W. van der Hoek^c, J.P. Stahl^b

Fever was the most frequent symptom, in more than 90% of notified cases. The other reported symptoms were: flu-like syndrome with malaise and headaches in 63 to 92% of cases, coughing in 66% of cases, nocturnal hyperhidrosis in 80% of cases. Pneumonia concerned 66% of notified cases, hepatic presentations were more rare (15%) than in previous outbreaks, especially compared to the French outbreak in Chamonix [4,9,15,23]. The male/female ratio of notified cases in 2007 and 2008 was 1.7/1, with an average age of 51 years [9].

Clinical Features and Complications of *Coxiella burnetii* Infections

TABLE 2 The Dutch consensus guidelines criteria for chronic Q fever^a

Category and criterion (criteria)^b

Proven chronic Q fever

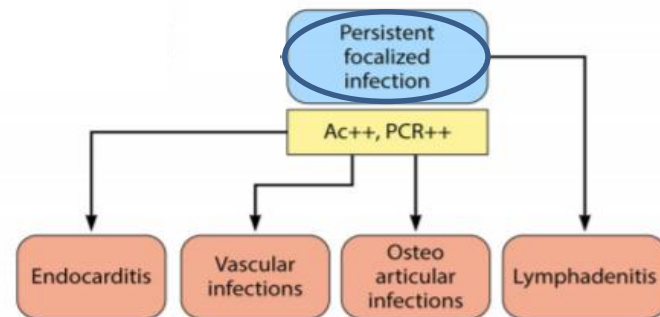

- Positive *C. burnetii* PCR in blood or tissue **or**
- IFA titer of $\geq 1:1,024$ for *C. burnetii* phase I IgG **and**
- Definite endocarditis according to the modified Duke criteria **or**
- Proven large-vessel or prosthetic infection by imaging studies (18 F-FDG PET, CT, MRI, or AUS)

Probable chronic Q fever

- IFA titer of $\geq 1:1,024$ for *C. burnetii* phase I IgG **and** one or more of the following criteria:
 - Valvulopathy not meeting the major criteria of the modified Duke criteria
 - Known aneurysm and/or vascular or cardiac valve prosthesis without signs of infection by means of TEE/TTE, 18 F-FDG PET, CT, MRI, or abdominal Doppler ultrasound
 - Suspected osteomyelitis or hepatitis as manifestation of chronic Q fever
 - Pregnancy
 - Symptoms and signs of chronic infection such as fever, wt loss, and night sweats, hepatosplenomegaly, persistent elevated ESR and CRP
 - Granulomatous tissue inflammation, proven by histological examination
 - Immunocompromised state

Possible chronic Q fever

- IFA titer of $\geq 1:1,024$ for *C. burnetii* phase I IgG without manifestations meeting the criteria for proven or probable chronic Q fever

Fièvre Q infection focalisée persistante « Chronique »

Figure 1. Growth of *Coxiella burnetii* Nine Mile Phase 2 in ACCM-2 medium. Genomes in the culture were calculated at the start of the culture and again on day 8 using qPCR. Robust growth of *C. burnetii* was observed at pH 5.5 and lower, but not at pH 6 and higher. Error bars represent 95% confidence intervals.

Traitement : Fièvre Q aigue

- Evolution spontanément favorable en 15 jours
- Antibiotiques actifs *in vitro* et *in vivo* bactériostatiques
 - Ofloxacin, Pefloxacin, Erythromycine, Chloramphenicol, Cotrimoxazole, Ceftriaxone
- **Doxycycline (200 mg/j)** 14 j reste le traitement de choix, si possible débuté précocement
- ATB diminue le risque d'hospitalisation
- Quinolones: intérêt dans les méningo-encéphalites
- Alternatives à la doxycycline= clarithromycine (500 mg twice daily), fluoroquinolones (ofloxacin 200 mgx3/j), ou co-trimoxazole (160 mg trimethoprim et 800 mg sulfamethoxazole 2x/j)

Traitement : Fièvre Q focalisée persistante/chronique

- Etudes *in vitro* :

- Alkalinisation des phagolysosomes: impact sur la croissance bactérienne? Amélioration de l'activité de la doxy? bactéricidie?

- Implications thérapeutiques:

- Ajout d'Hydroxychloroquine à la doxycycline

→ Endocardites: Doxycycline+ Hydroxychloroquine
18 mois si valve native, 24 mois si valve prothétique

→ Infections vasculaires:

Traitement prolongé et Retrait du matériel prothétique+++++

→ Autres infections persistantes: Doxycycline+ Hydroxychloroquine 18 mois

Reference: TET/HCO	60	1.00	n/a	n/a
TET/QLN	7	0.93	0.39–2.19	.86
TET/QLN/HCO	4	1.21	0.37–3.96	.75
TET	9	1.43	0.67–3.04	.35
QLN	15	1.26	0.68–2.35	.47

Conclusions. Treatment of chronic Q fever with TET plus QNL appears to be a safe alternative for TET plus HCO, for example, if TET plus HCO cannot be tolerated due to side effects. Treatment with TET plus QNL plus HCO was not superior to treatment with TET plus HCO, although this may be caused by confounding by indication. Treatment with TET or QNL monotherapy should be avoided; switches due to subjective, insufficient clinical response were frequently observed.

Etude rétrospective, peu de cas, traitements très hétérogènes en molécules, durées et sans puissance statistique pour conclure

- **Donc le débat n'est pas tranché:**

A ce stade, faible niveau de preuve pour HCQ+doxy dans les formes persistantes de fièvre Q

MAIS niveau de preuve concernant les alternatives tout aussi faible voire plus

- Pour conclure il faut un essai randomisé +/- contrôlé +++
- Forcement essai international vu l'incidence de ces formes
- Difficile à mener car formes cliniques sont très hétérogènes
- Besoin d'études bien conduites, sans « passion » pour proposer le meilleur traitement au patient

Table 2. Antibiotic treatment for major rickettsial infections, strength of recommendation and quality of evidence for adults and children.

Group	Disease	Regimen	Grade*	Adults	Children†	Pregnant women
SFG	Mediterranean spotted fever	Preferred	A I	Doxycycline 200 mg two oral doses in a single day	–	–
			A III	Doxycycline 200 mg single dose or 100 mg twice daily for 2–5 days	Doxycycline 2.2 mg/kg every 12 h for children weighing <100 lb (45 kg) or adult dosage if ≥100 lb, for 5–10 days	Josamycin 1 g every 8 h for 5 days (in severe form of Mediterranean spotted fever, single dose of doxycycline should be used)
		Alternatives	A I	Josamycin‡ 1 g every 8 h for 5 days	Josamycin 50 mg/kg every 12 h for 5 days	–
			A I	–	Clarithromycin 15 mg/kg/day in 2 divided doses for 7 days	–
					Azithromycin 10 mg/kg/day in 1 dose for 3 days	–
				B–D III	Ciprofloxacin	–
	Rocky Mountain spotted fever	Preferred	A III	Doxycycline 100 mg every 12 h for 5–10 days	Doxycycline 2.2 mg/kg every 12 h for children weighing <99 lb (45 kg), or adult dosage if ≥100 lb, for 5–10 days	Doxycycline 100 mg every 12 h for 5–10 days‡
		Alternatives	A III	–	Chloramphenicol 12.5–25 mg/kg every 6 h for 5–10 days	–
	Other SFG rickettsioses	Preferred	A III	Doxycycline 200 mg single dose or 100 mg twice daily for 2–5 days	–	–
Typhus group	Murine typhus	Preferred	A III	Doxycycline 100 mg, twice daily, continued for 3 days after symptoms have resolved	Doxycycline 100–200 mg, for 3–7 days	Doxycycline (late trimester)
				Doxycycline 100–200 mg, single dose	–	–
		Alternatives	D III	Fluoroquinolones	–	Erythromycin
			D III	Chloramphenicol 60 to 75 mg/kg/day in four divided doses	Chloramphenicol	Chloramphenicol (early trimester; first and second trimesters)
	Epidemic typhus	Preferred	A II	Doxycycline 200 mg for 5 days, or 2–4 days after defervescence	–	–
			A III	Doxycycline 100–200 mg, single dose in outbreak situations	Doxycycline 100–200 mg, single dose	Doxycycline 100–200 mg, single dose
	Alternatives	D III	Chloramphenicol 60 to 75 mg/kg/day in four divided doses	–	–	

*Strength of recommendation and quality of evidence is used as previously reported [96].

†Tetracycline antibiotics are generally contraindicated in children under 8 years because of the dose-dependent risk of staining of permanent teeth; however, these antibiotics are superior therapy for Rocky Mountain spotted fever and doxycycline is the drug of choice for therapy of this life-threatening disease in patients of all ages. Shorter treatment courses may be warranted in some pediatric settings; however, therapy should be continued for at least 48 h following lysis of fever and evidence of clinical improvement.

‡Tetracycline antibiotics are generally contraindicated during pregnancy because of the risks associated with interference in the development of teeth and long bones in the fetus. However, because Rocky Mountain spotted fever is a life-threatening illness, and because of the demonstrated superiority of doxycycline as therapy for this infection, this drug represents the antibiotic of choice.

I: Evidence from ≥1 properly randomized controlled trials; II: Evidence from ≥1 well-designed clinical trial without randomization or from cohort or case-controlled analytical studies; III: Evidence from opinions of respected authorities based on clinical experience, descriptive studies, or reports from expert committees; A: Good evidence; B: Moderate evidence; C: Limited evidence to support a recommendation for use;

D: Limited evidence does not support a recommendation for use; SFG: Spotted fever group;

Data taken from [35,29,37–39,54,62,95].

Analysis of risk factors for malignant Mediterranean spotted fever indicates that fluoroquinolone treatment has a deleterious effect

Deleterious effect of ciprofloxacin on *Rickettsia conorii*-infected cells is linked to toxin–antitoxin module up-regulation

Elisabeth Botelho-Nevers, Sophie Edouard, Quentin Leroy and Didier Raoult*

Antibiotic treatment recommendations for facultative intracellular bacteria-related diseases

Disease	Adult	Child
Legionellosis	Levofloxacin 750mg Azithromycin 500mg 7-10 days	Erythromycin 50 mg/kg/day or newer macrolides
Acute brucellosis	Doxycycline 100mg bid with rifampicin (rifampin) 300mg tid or with Gentamicin 5mg/kg 6wk	Age >8y: doxycycline 2.5 mg/kg bid with rifampicin 20mg/kg/day or with streptomycin 1.5-2.5 mg/kg/day, 6wk Age <8y: cotrimoxazole (trimethoprim-sulfamethoxazole) 25-5 mg/kg/day bid with rifampicin 20 mg/kg/day or with streptomycin 1.5-2.5 mg/kg/day, 6wk
Typhoid	Azithromycin 1g then 500 mg 5-7 days or ceftriaxone 2g IV/IM, 7-10 days or cotrimoxazole 800-160mg bid, 14 days	Ceftriaxone 100 mg/kg/day , 7-10 days or cotrimoxazole 25-5 mg/kg bid, 14 days
<i>Salmonella</i> enteritis	Ciprofloxacin 500mg bid, 5 days or ceftriaxone 2g IV/IM, 5 days or cotrimoxazole 960mg bid, 5-7 days	Cotrimoxazole 25-5 mg/kg bid, 5-7 days if necessary
Yersiniosis	Gentamicin 3mg/kg/day in 2-3 doses, 7-14 days or doxycycline 100mg bid, 7-14 days or ciprofloxacin 500mg bid, 7-14 days	Gentamicin 3 mg/kg/day in 2-3 doses, 7-14 days
<i>Mycoplasma hominis</i>	Doxycycline 100mg bid, 7 days or clindamycin 500mg qid, 7 days or ciprofloxacin 500mg bid, 7 days	
<i>Ureaplasma urealyticum</i>	Doxycycline 100mg bid, 7 days or erythromycin 500mg qid, 7 days	
<i>M. pneumoniae</i>	Azithromycin 500mg 5 days or doxycycline 100mg bid 7 days	Erythromycin 50 mg/kg/day, 14-21 days or newer macrolides
Bacillary angiomatosis and <i>Bartonella</i> endocarditis	Gentamicin 3 mg/kg/day in 2-3 doses with erythromycin 500mg qid or with doxycycline 100mg bid or with ceftriaxone 2g IM once daily, 4-6wk	Gentamicin 3 mg/kg/day in 2-3 doses with erythromycin 50 mg/kg/day or with ceftriaxone 100 mg/kg/day IM, 4-6wk

Abbreviations: bid = twice daily; IM = intramuscular; IV = intravenous; qid = 4 times daily.

S. aureus

S. aureus: bactérie intracellulaire!

B. Löffler et al. / International Journal of Medical Microbiology 304 (2014) 170–176

Fig. 1. Electron micrographs of different types of infected host cells. Adherence and uptake of *S. aureus* in epithelial A549 cells (A). Intracellular location of *S. aureus* after infection of primary osteoblasts (B). Dividing figure of *S. aureus* within an intracellular phagosome (C) and intracellular bacterial degradation (D) 24 h after infection of endothelial cells (HUVEC).

Kalinka et al., Int J Med Microbiol. 2014; 304:1038-49

Figure 2. Intracellular persistence of *Staphylococcus aureus* within phagolysosomes. A549 cells were infected with *S. aureus* Cowan, and extracellular bacteria were killed by addition of flucloxacillin (1 mg/mL). *A*, The number and phenotype of viable intracellular persisting bacteria were determined at indicated time points. Data are mean values (\pm standard errors of the mean) pooled from 2 experiments performed in triplicate. *B*, The intracellular localization of persisting bacteria (CFSE; green) was analyzed by fluorescence microscopy. Lysosomes were visualized with LAMP-2 antibody (Alexa Fluor 594; red) and nuclei were stained with DAPI (blue). Scale bars 20 μ m and 5 μ m, respectively. Abbreviations: CFU, colony-forming units; SCV, small-colony variant.

Nonstable *Staphylococcus aureus* Small-Colony Variants Are Induced by Low pH and Sensitized to Antimicrobial Therapy by Phagolysosomal Alkalinization

Table 3 Results of multivariate analysis (Cox model) predicting the risk of failure at 2 years of follow-up in patients with onset of infection < 3 months and the entire cohort

Variables	Onset of infection < 3 months $n = 89$		All patients $n = 137$	
	HR [95% CI]	p	HR [95% CI]	p
Incomplete rifampin regimen	0.5 [0.16–1.6]	0.248	0.5 [0.2–1.28]	0.151
Complete rifampin regimen	0.16 [0.03–0.82]	0.028	0.08 [0.018–0.36]	0.001
Treatment duration	0.76 [0.66–0.89]	0.001	0.78 [0.69–0.88]	< 0.001
Active smoking	3.29 [0.8–13.41]	0.097	3.6 [1.09–11.84]	0.036
Early acute	0.25 [0.09–0.7]	0.009	–	–

En situation de portage

16,1% porteurs *S. aureus* au niveau nasal avec localisation intracellulaire

Figure 5: Visualisation de *S. aureus* intracellulaire au niveau de cellules HNECs issues d'écouvillonnage nasal (A) et de culture de HaCaT (B). Le contour cellulaire est coloré en rouge, l'acide nucléique en bleu et *S. aureus* en vert. Les échelles graphiques représentent 10 μm .

Figure 2. Impact of antimicrobial compounds on intracellular *S. aureus* load in HaCaT cells. Bars represent the mean with standard error of 6 values. The decrease of intracellular *S. aureus* load was compared to the lysostaphin control set to zero (* $P < 0.05$; ** $P < 0.01$; *** $P < 0.001$).

Adjunctive rifampin for the treatment of *Staphylococcus aureus* bacteremia with deep infections: A meta-analysis

Huan Ma¹, Jie Cheng^{2,3}, Lengyue Peng¹, Yawen Gao¹, Guangli Zhang¹, Zhengxiu Luo^{1,2,3*}

3. Forest plot: Impact of adjunctive rifampin therapy on mortality of SAB. RR, risk ratio, CI, confidence interval.

5. Forest plot: Influence of adjunctive rifampin therapy on rate of bacteriologic failure. RR, risk ratio, CI, confidence interval.

6. Forest plot: Influence of adjunctive rifampin therapy on relapse rate. RR, risk ratio, CI, confidence interval.
