

17^e Journée des Référents en Antibiothérapie

BORDEAUX

15 juin 2022

Traitement des infections urinaires : toujours plus court ?

15/06/2022

Matthieu Lafaurie

Unité transversale d'antibiothérapie

Hôpital Saint-Louis

Paris

Madame Brull Laurine

- Pollakiurie, urgenturie, douleurs sus pubiennes depuis 3 heures.
- Aucun ATCD
- Vous diagnostiquez brillamment une cystite aiguë et la BU vous conforte.

Quelle durée d'antibiotique la plus courte vous paraît raisonnable?

- 0 jour
- 1 jour
- 3 jours
- 5 jours
- 7 jours

Infections urinaires basses de la femme

Recommandations SPILF

Cystite compliquée

- Pivmécillinam 5 jours, 400 mg x2/j
- Furadantine 7 jours, 100 mg x 3/j

Cystite simple

- fosfomycine-trométamol, une dose unique de 3 g

MAIS...

Effect of 5-Day Nitrofurantoin vs Single-Dose Fosfomycin on Clinical Resolution of Uncomplicated Lower Urinary Tract Infection in Women

JAMA Huttner et al. 2018

Clinical and Bacteriologic Outcome	No./Total No. (%)		Difference, % (95% CI)	P Value ^a
	Nitrofurantoin (n = 255)	Fosfomycin (n = 258)		
Primary Outcome				
Clinical response at 28 d ^b				
Clinical resolution	171/244 (70)	139/241 (58)	12 (4-21)	.004
Clinical failure	66/244 (27)	94/241 (39)		
Indeterminate	7/244 (3)	8/241 (3)		
Missing ^c	11 (4)	17 (7)		
Microbiologic response at 28 d ^b				
Culture obtained/baseline culture positive	175/194 (90)	163/183 (89)		
Bacteriologic success through 28 d	129/175 (74)	103/163 (63)	11 (1-20)	.04
Bacteriologic success failure by 28 d	46/175 (26)	60/163 (37)		

Trometamol-Fosfomycin (Monuril) Bioavailability and Food-Drug Interaction

E. Bergogne-Bérézin, C. Muller-Serieys, M.L. Joly-Guillou, N. Dronne Eur. Urol. 13: suppl. 1, pp. 64–68 (1987)

	Food absorption	
	before	after
<i>Serum</i>		
C_{max} , µg/ml	22.55 ± 6.03	12.74 ± 6.27
t_{max} , h	2.50 ± 1.08	3.98 ± 2.15
$t_{1/2\beta}$, h	7.31 ± 1.74^1	10.29 ± 3.47
AUC, µg/ml/h	227.86 ± 44.92	168.45 ± 57.11
<i>Urine</i>

Alternatives aux antibiotiques en thérapeutique: ibuprofène/diclofénac?

- Pour quelles patientes?
 - cystite non compliquée chez les patientes non ménopausées en bonne santé, non enceintes, et sans antécédent de pyélonéphrite.
 - Tolérance des symptômes de cystite acceptable...
- 3 études ibuprofène, 1 diclofénac

Ibuprofen versus fosfomycin for uncomplicated urinary tract infection in women: randomized controlled trial

Gágyor et al. BMJ 2015.

Ibuprofen (n=248) 3j vs fosfo (n=246) 1 dose

Guérison sans antibiotiques: 67% des femmes du groupe ibuprofen
Pyélonéphrite aiguë: ibuprofen 5, fosfo 1

Ibuprofen versus pivmecillinam for uncomplicated urinary tract infection in women—A double-blind, randomized non-inferiority trial VIK et al. PLOS medicine 2018

Pivmécillinam vs ibuprofen pendant 3 jours

Table 2. Summary of primary and key secondary outcomes in women with uncomplicated UTI randomized to either ibuprofen or pivmecillinam: Intention to treat population.

Outcome	Ibuprofen (n = 181)	Pivmecillinam (n = 178)	Adjusted risk difference (95% CI)
Primary outcome			
Patients without symptoms by day 4	70 (39)	131 (74)	35% (27% to 43%)*
Secondary outcomes			
Patients without symptoms by day 7	114 (63)	162 (91)	28% (20% to 36%)
Patients without symptoms by day 14	141 (78)	167 (94)	16% (9% to 23%)
Median symptom duration after randomization (days)	6	3	
Urine cultures after 14 days**			
Urine culture positive	43 (28)	16 (10)	−16% (−26% to −7%)
Growth of primary pathogens	29 (19)	6 (4)	−14% (−23% to −6%)
Relapses/complications**			
Secondary treatment with antibiotics by day 14	73 (41)	14 (8)	−32% (−40% to −24%)
Secondary treatment with antibiotics by day 28	83 (46)	18 (10)	−36% (−44% to −27%)
Patients with febrile UTI†	5 (3)	0 (0)	−3% (−6% to 0.1%)
Patients with pyelonephritis†	7 (4)	0 (0)	−4% (−8% to −1%)
Serious adverse events	6 (3)	1 (1)	−3% (−6% to 0.1%)

A J 28: 53% guérison sans antibiotiques dans le groupe ibuprofène

Summary of use of antibiotics (ITT population A, $n = 382$)

Characteristic	Group 1 ^a (uva-ursi + ibuprofen advice) ($n = 102$)	Group 2 ^a (Placebo + Ibuprofen advice) ($n = 86$)	Group 3 ^a (uva-ursi + No ibuprofen advice) ($n = 97$)	Group 4 ^a (Placebo + No Ibuprofen advice) ($n = 97$)
Use of antibiotics at any time during Week 1, n (%)	17 (24.3)	21 (35.6)	33 (45.2)	41 (55.4)
Use of antibiotics at any time during Week 1 and Week 2, n (%)	24 (34.3)	21 (35.6)	33 (45.2)	42 (56.8)
Use of antibiotics as recorded in the medical notes review, n (%) ^c	21 (77.8)	15 (83.3)	22 (91.7)	23 (85.2)

- 
- Uva-ursi: 39.9% vs. placebo 47.4%; logistic regression odds ratio (OR) 0.59 (95%CI 0.22e1.58; p 0.293)
 - ibuprofen advice: 34.9% vs. no advice 51.0%; OR 0.27 (95% CI 0.10 to 0.72; p 0.009)
 - Pas de PNA

Pyélonéphrite aiguë

- Recommandation SPILF
 - 7 jours si fluoroquinolones et/ou B-lactamine parentérale
 - 5 jours si aminosides
- Possible avec Trimethoprim-Sulfamethoxazole?
- Peut on faire plus court?

A Seven-Day Course of Trimethoprim-Sulfamethoxazole May Be as Effective as a Seven-Day Course of Ciprofloxacin for the Treatment of Pyelonephritis. M. Fox *et al.* Am J Med. 2017

- Etude multicentrique, retrospective, femmes, Pyélonéphrite aiguë à *E. coli* CFU/mL sensible.

Pre-existing conditions			
Diabetes	12 (15%)	30 (16%)	1.00
Human immunodeficiency virus	2 (2%)	6 (3%)	1.00
Chemotherapy in past 6 months	1 (1%)	4 (2%)	1.00

Cefepime	4 (5%)	19 (10%)
Aztreonam	0	10 (5%)

**Critère principal: infection urinaire (signes cliniques et $\geq 10^5$ E. coli/mL)
dans les 30 jours suivant initiation ttt**

TMP-SMX: 6 (7%) / Ciprofloxacine: 12 (6%)

OR 1,19 (95%CI 0,43-3,3)

ORa (hospitalisation, bactériémie): 2,3 (95%CI 0,72-7,42)

Plus court que 7 jours pour les pyélonéphrites aiguës?

A trial of levofloxacin 750 mg once daily for 5 days versus ciprofloxacin 400 mg and/or 500 mg twice daily for 10 days in the treatment of acute pyelonephritis

Klausner, Brown, Peterson, Kaul, Khashab, Fisher, Kahn Curr Med Res Opin. 2007

Sous étude d'une autre publiée un peu plus tard dans un autre journal en en parlant à peine.

Biais +++:

- Utilisation de 2 FQ différentes
- Forte dose de lévofloxacine
- Problème définition de la PNA: fièvre 70/94 groupe lévo et 78/98 groupe cipro
- IC des différences (clinique/microbio) larges et comprenant 1.

Données pas utilisables...

Treatment of complicated urinary tract infection and acute pyelonephritis by short-course intravenous levofloxacin (750 mg/day) or conventional intravenous/oral levofloxacin (500 mg/day): prospective, open-label, randomized, controlled, multicenter, non-inferiority clinical trial

Hong Ren et al. Int Urol Nephrol (2017)

- Etude prospective, ouverte, contrôlée, multicentrique, de non infériorité.
- Critères d'inclusion: Infection urinaire compliquée ou PNA
- Lévofoxacine 750 mg IV 1x/j pdt 5 jours
- Lévofoxacine 500 mg 1X/j pdt 7 à 14 jours (IV puis per os).
- Critère principal de jugement: efficacité clinique EOT

	LVFX 500 mg	LVFX 750 mg	Total
Number of patients	165 (100.00%)	165 (100.00%)	330 (100.00%)
Completed protocol	122 (73.94%)	125 (75.76%)	247 (74.85%)

Diagnostic result

Effectiveness	86.30% (63/73)	89.55% (60/67)	0.556

Is 5 days of oral fluoroquinolone enough for acute uncomplicated pyelonephritis? The DTP randomized trial.

Dinh et al. Eur J Clin Microbiol Infect Dis (2017)

- Etude multicentrique, ouverte, randomisée, non infériorité
- 5 vs 10 j de FQ (ofloxacine 200 x2 ou lévoflox 500 x1/j)
- Critère de jugement principal: guérison à J30.
- Arrêt prématuré de l'essai car recrutement insuffisant (taux élevé de FQ résistance et pertues de vue)
- Post hoc analyse, comparaison guérison à J10 et J30.

Taux de guérison clinique (5j vs 10j)

- J10: 28 (93,3%) vs 36 (94,7%)
- J30: 23 (100%) vs 20 (100%)

Taux de guérison microbiologique J30 (5j vs 10 j)

- 20/23 (87%) vs 16/20 (80%)

Pas de données solides pour conseiller un traitement de moins de 7 jours pour les pyélonéphrites aiguës

En pratique, qui fait quoi?

Mr P. 83 ans, brulures urinaires, urgenturie depuis 5 jours. Pas de fièvre.

ECBU: *E. coli* 10^5 cfu/mL, sauvage, GB 95000/mL.

ATCD: IDM, hypercholestérolémie, PTH, **prostatectomie radicale pour ADK**,

Quel traitement, quelle durée?

- Nitrofurantoïne: 7 jours
- Ofloxacine: 14 jours
- Fosfomycine: J1-J3-J5
- Cotrimoxazole: 7 jours
- Cotrimoxazole: 10 jours
- Ciprofloxacine: 21 jours
- Pivmécillinam: 5 jours

En pratique, qui fait quoi?

Mr P. 83 ans, brulures urinaires, urgenturie depuis 5 jours. Pas de fièvre.

ECBU: *E. coli* 10^5 cfu/mL, sauvage, GB 95000/mL.

ATCD: IDM, hypercholestérolémie, PTH, **hypertrophie bénigne de la prostate**

Quel traitement, quelle durée?

- Nitrofurantoïne: 7 jours
- Ofloxacine: 14 jours
- Fosfomycine: J1-J3-J5
- Cotrimoxazole: 7 jours
- Cotrimoxazole: 10 jours
- Ciprofloxacine: 21 jours
- Pivmécillinam: 5 jours

En pratique, qui fait quoi?

Mr P. 83 ans, brûlures urinaires, urgenturie depuis 5 jours. Pas de fièvre. ECBU: 10^5 E. coli, GB 125/mm³, sauvage.

ATCD: IDM, hypercholestérolémie, PTH, hypertrophie bénigne de la prostate

Quel traitement, quelle durée?

Avant de répondre: quelle infection traite t'on?

- Fosfomycine: J1-J3-J5
- Bactrim 7 jours
- Bactrim 10 jours
- Ciprofloxacine: 21 jours
- Pivmécillinam: 5 jours

TERMINOLOGIE

- **Cystite masculine**

SPILF: entité non individualisée dans les recommandations françaises

EAU (urologie Europe): « la cystite chez l'homme sans atteinte de la prostate est rare »

- **Infection urinaire de l'homme**

SPILF: infection urinaire masculine fébrile/non fébrile

EAU: classification du National Institute of Health (NIH) distinguant la prostatite aiguë de la prostatite chronique

Nombre	Catégorie	Caractéristiques	Signes présents dans l'urine	Prémassage	Post- massage
I	Prostatite bactérienne aiguë	Symptômes aigus d'infection urinaire	Globules blancs	+/-	+
			Bactéries	+/-	+
II	Prostatite bactérienne chronique	Infection urinaire récidivante par un même microorganisme	Globules blancs	+/-	+
			Bactéries	+/-	+
III	Prostatite chronique/syndrome de douleur pelvienne chronique	Principalement des douleurs, des troubles mictionnels et une dysfonction sexuelle			
IIIa	Inflammatoires		Globules blancs	-	+
			Bactéries	-	-
IIIb	Non inflammatoire*		Globules blancs	-	-
			Bactéries	-	-
IV	Prostatite inflammatoire asymptomatique		Découverte fortuite lors de l'évaluation urologique (p. ex., biopsie de la prostate, analyse du liquide séminal) pour d'autres pathologies	Globules blancs	-
		Bactéries		-	-
*Précédemment appelé prostatodynie.					
+/- signifie éventuellement présents; + signifie présents; - signifie absent.					

TRAITEMENT

SPILF

La notion de fièvre disparaît pour le choix et la durée des antibiotiques

- *Si fièvre*: ttt probabiliste
- *Apyrexie et infection « bien » tolérée* : ttt différé selon documentation microbiologique si possible
- Durée :
 - 14 j si fluoroquinolone, cotrimoxazole, β -lactamines injectables
 - 21 j pour les autres molécules **OU** si uropathie sous jacente non corrigée (= troubles mictionnels préexistants, lithiase...)

En pratique, selon SPILF

Mr P. 83 ans, brûlures urinaires, urgenturie depuis 5 jours. Pas de fièvre.

ECBU: *E. coli* 10^5 cfu/mL, sauvage, GB 95000/mL.

ATCD: IDM, hypercholestérolémie, PTH, hypertrophie bénigne de la prostate

Quel traitement, quelle durée?

- Furandantine 7 jours
- Ofloxacine 14 jours
- Fosfomycine: J1-J3-J5
- Bactrim 7 jours
- Bactrim 10 jours
- Ciprofloxacine: 21 jours
- Pivmécillinam: 5 jours

En pratique, selon SPILF

Mr P. 83 ans, brûlures urinaires, urgenturie depuis 5 jours. Pas de fièvre.

ECBU: *E. coli* 10^5 cfu/mL, sauvage, GB 95000/mL.

ATCD: IDM, hypercholestérolémie, PTH, prostatectomie radicale

Quel traitement, quelle durée?

- Furandantine 7 jours
- Ofloxacine 14 jours
- Fosfomycine: J1-J3-J5
- Bactrim 7 jours
- Bactrim 10 jours
- Ciprofloxacine: 21 jours
- Pivmécillinam: 5 jours

?

Infection urinaire non fébrile de l'homme

- Hommes souvent inclus dans les études de traitement des cystites compliquées, mais de façon variable et minoritaire (jusqu'à 10%).
- Quelques données spécifiques chez l'homme, essentiellement rétrospectives

Urinary Tract Infection in Male General Practice Patients:
Uropathogens and Antibiotic Susceptibility. J. J. Koeijers, et al. UROLOGY 76 (2), 2010

- Cohorte de ville, 2013-2014.
- Hommes, >18 ans, infection urinaire non fébrile: dysurie aigue, pollakiurie et/ou urgenturie, <38°, pas de signes généraux, pas de matériel.
- 422 hommes, 18-104 ans.
- Traitement antibiotique prescrit dans 60% des cas.

Antibiotic Treatment	Age Category			Total N = 253
	18-50 y n = 86	51-70 y n = 99	>70 y n = 68	
Amoxicillin	1	3	0	2
Co-amoxicillin	10	12	10	11

Neurogenic bladder disorder	1.04	0.35–3.13	0.942	0.40	0.05–3.14	0.322

Pas de différence significative

- échec selon antibiotique
- rechutes selon antibiotique
- rechutes selon ≤ 7 j vs > 7 j de façon globale
- Rechutes plus fréquentes avec pivmécillinam ≤ 7 j vs > 7 j

Effectiveness and safety of nitrofurantoin in outpatient male veterans.

Ingalsbe *et al.* Therapeutic advances in Urology, 2015

- Etude rétrospective, 2004-2013, EU.
- **Guérison clinique:** absence de signes urinaires 14 jours après fin du traitement par furadantine.

 485 patients pour analyse efficacité

- Dose: 100 mg x2/jour dans 71% des cas
- **Guérison: 77%**
- Meilleure efficacité si clairance >60 ml/min et gram négatifs vs gram positifs
- **Durée traitement: succès clinique $8,6 \pm 3,6$ versus échec $9,3 \pm 6,9$ jours ($p=0,28$)**

Treatment duration of pivmecillinam in men, non-pregnant and pregnant women for community-acquired urinary tract infections caused by *Escherichia coli*:
a retrospective Danish cohort study Boel *et al.* JAC 2019

- Cohorte rétrospective, 2010-2016.
- **Inclusion:** femmes et hommes, > 18 ans, traitement empirique par pivmecillinam pour bactériurie significative à *E. coli*. Infection urinaire basse.
- Stratification (selon durée ttt 3,5 ou 7j/sexe/age 18–50, 51–70 ou >70 ans/ESBL vs non-ESBL).
- Pivmécillinam: 400mg x3/j
- **Echec:** prescription d'un antibiotique au décours ou hospitalisation pour infection urinaire

Table 1. Descriptive characteristics of the 21 864 cases of *E. coli* bacteriuria treated with pivmecillinam

Descriptive characteristic	Duration of pivmecillinam therapy (days)		
	3	5	7
Total number of participants (%)	4837 (22.1%)	9411 (43.0%)	7616 (34.8%)
Men/women (% men)	215/4622 (4.4%)	944/8467 (10.0%)	1365/6251 (17.9%)
Median age, years (IQR)	35 (26–54)	52 (32–71)	63 (42–77)
Age, N (%) [men/women]			
18–50 years	3482 (72.0%) [58/3424]	4539 (48.2%) [224/4315]	2604 (34.2%) [310/2294]
51–70 years	749 (15.5%) [85/664]	2417 (25.7%) [373/2044]	2291 (30.1%) [514/1777]

Fosfomycin in the treatment of extended spectrum beta-lactamase-producing *Escherichia coli*-related lower urinary tract infections

Pullukcu et al. International Journal of Antimicrobial Agents(2007)

- Cohorte rétrospective observationnelle
- 52 adultes, **25 hommes**
 - SFU (dysurie, pollakiurie, urgenterie)
 - Leucocyturie et *E. coli* >10⁵, BLSE.
 - Pas de fièvre, pas d'hyperleucocytose
 - Ttt probabiliste par fosfomycine trometamol: 3 g J1-J3-J5
 - ECBU de contrôle à 7 à 9 jours
- Succès clinique et microbiologique: 94.3% (49/52) et 78.5% (41/52)

Pas de détails hommes/femmes

Matthews *et al.* Oral fosfomycin for treatment of urinary tract infection: a retrospective cohort study. *BMC Infect Dis.* 2016

- Cohorte rétrospective observationnelle
- 75 adultes, **18 hommes**
 - SFU (dysurie, pollakiurie, urgenterie)
 - Leucocyturie et uropathogène $>10^5$ (31/52 (59%) BLSE).
 - Pas de fièvre, pas d'hyperleucocytose
 - Ttt probabiliste par fosfomycine trometamol 3 g, médiane J1-J3-J5
- ECBU stérile, 21/40 (53%), follow-up 13 jours
- Guérison clinique ou ECBU stérile: 42/61 (69%)
- FDR échec : infection à *K. pneumoniae*
- Infection chez l'homme: pas FDR d'échec

Marge infériorité: 10%, puissance 85%
Effectif nécessaire:290 patients

Table 3. Primary and Secondary Outcomes

Characteristic	No./total No. (%)		
Resolution of UTI symptoms 14 days after stopping active antimicrobials	7-Day antimicrobial + 7-day placebo group	14-Day antimicrobial group	Absolute difference, % (1-sided 97.5% CI) ^a
As-treated population (primary analysis)	122/131 (93.1)	111/123 (90.2)	2.9 (-5.2 to ∞)
As-randomized population	125/136 (91.9)	123/136 (90.4)	1.5 (-5.8 to ∞)
Recurrence of UTI symptoms within 28 days of stopping study medication (secondary outcome)	7-Day antimicrobial + 7-day placebo group	14-Day antimicrobial group	Absolute difference, % (2-sided 95% CI) ^b
As-treated population	13/131 (9.9)	15/123 (12.9)	-3.0 (-10.8 to 6.2)
As-randomized population	14/136 (10.3)	23/136 (16.9)	-6.6 (-15.5 to 2.2)

Abbreviation: UTI, urinary tract infection.

^a The primary analysis used a 1-sided 97.5% CI for noninferiority, which was established if the lower bound of the 1-sided 97.5% CI did not cross the noninferiority margin of -10% difference in symptom resolution.

^b The secondary outcome was analyzed using a 2-tailed superiority hypothesis test of differences in proportions (2-sample test for equality of proportions with continuity correction) with $\alpha = .05$ and with 2-sided 95% CIs.

Among afebrile men with suspected UTI, treatment with ciprofloxacin or trimethoprim/sulfamethoxazole for 7 days was non inferior to 14 days of treatment with regard to resolution of UTI symptoms by 14 days after antibiotic therapy.

Table 1. Baseline Demographics and Comorbid Conditions^a

Variable	7-Day antimicrobial + 7-day placebo group (n = 136) ^{b,c}	14-Day antimicrobial group (n = 136) ^c

Durée de traitement infection urinaire masculine non fébrile

- Éléments de preuve...pas tout à fait irréfutables, mais qui s'accumulent

Antibiotique par voie orale	Dose journalière	durée
Pivmécillinam	400 mg x2 (ou x3)	7 jours (5)
Nitrofurantoïne	100 mg x3	7 jours
Fosfomycine trométamol	3 g	J1, J3 +/- J5
TMP-SMZ	800 mg x2	7 jours
Fluoroquinolone		7 jours
- ofloxacin	200 mg x2	
- lévofloxacin	500 mg x1	
- ciprofloxacin	500 mg x2	

Infection urinaire masculine fébrile?

Ciprofloxacin for 2 or 4 Weeks in the Treatment of Febrile Urinary Tract Infection in Men
A Randomized Trial with a 1 Year Follow-up. Ulleryd et Sandber, Scand J Infect Dis, 2003.

- Etude prospective, randomisée, en ouvert, monocentrique (1993-1996)
- Objectif:
 - non infériorité
 - éradication bactérienne, 2 semaines post traitement (hypothèse de 95% de guérison microbiologique)
 - marge infériorité: 20% de différence
 - effectif 100 patients
- Adultes, $\geq 38^{\circ}\text{C}$, au moins un signe: pollakiurie, dysurie, douleur flanc ou costo vertébrale, ECBU positif avec uropathogène sensible à la cipro.
- Patients hospitalisés, randomisation ciprofloxacine 500 mg x2/j; 2 vs 4 semaines

Table I. *Characteristics of study patients*

	Ciprofloxacin 500 mg b.i.d.	
	2 weeks	4 weeks
Patients randomized	57	57
Patients valid for efficacy analysis	38	34
Median age (y)	61 (18–85)	62 (30–77)
History of UTI	20 (53)	14 (41)
Median initial temperature (°C) ^a	39.3 (38.0–40.7)	39.6 (38.0–41.4)
Median initial CRP (mg/l)	135 (15–420)	130 (9–370)
Median initial WBC ($\times 10^9/l$)	13.2 (4.0–25.6)	13.6 (5.1–29.8)
Pyuria	28/35 (80)	28/33 (85)
Positive blood culture	7 (18)	3 (9)
Flank pain and/or costovertebral angle tenderness	12 (32)	15 (44)
Prostatic tenderness	5/32 (16)	4/34 (12)
Signs of prostatic involvement ^b	34 (89)	31 (91)

Table III. *Bacteria isolated from pretreatment urine cultures*

Organism	Ciprofloxacin 500 mg b.i.d.	
	2 weeks (<i>n</i> = 38)	4 weeks (<i>n</i> = 34)
<i>Escherichia coli</i> ^a	32 (5)	27 (3)
<i>Klebsiella</i> spp.	1	3
<i>Enterobacter</i> spp. ^a	2 (2)	0
Enterococci	0	3
Group B streptococci	2	0
<i>Staphylococcus epidermidis</i>	1	1

Table II. *Reasons for non-evaluation after randomization*

	Ciprofloxacin 500 mg b.i.d.	
	2 weeks (<i>n</i> = 19)	4 weeks (<i>n</i> = 23)
Not fulfilling inclusion criteria ^a	6	8
Other diagnosis than febrile UTI ^b	3	3
Negative initial urine culture	4	7
Isolated pathogen resistant to ciprofloxacin	1	0
No follow-up	2	3
Premature discontinuation of treatment because of an adverse event	0	1
Insertion of a permanent indwelling urinary catheter during treatment	3	1

Table IV. Cumulative <i>bacteriological cure</i> rate (%)		
	Ciprofloxacin 500 mg b.i.d.	
	2 weeks (n = 38)	4 weeks (n = 34)
2 weeks post-treatment	n = 38	n = 34
Bacteriological cure	34 (89)	33 (97)
Relapse	2	1
Reinfection	2	0
After 3 months	n = 36	n = 34
Bacteriological cure	27 (75)	29 (85)
Relapse	3	4
Reinfection	6	1
After 6 months	n = 33	n = 33
Bacteriological cure	21 (64)	27 (82)
Relapse	4	4
Reinfection	7	2
Unspecified recurrence	1	0
After 12 months	n = 32	n = 33
Bacteriological cure	19 (59)	25 (76)
Relapse	4	4
Reinfection	8	4
Unspecified recurrence	1	0

Pas de différence significative guérison clinique ni guérison microbiologique 2 semaines ou 12 mois post ttt

Table V. Cumulative *clinical cure* rate (%) and type of recurrent urinary tract infection (UTI)

	Ciprofloxacin 500 mg b.i.d.	
	2 weeks (n = 38)	4 weeks (n = 34)
2 weeks post-treatment	n = 38	n = 34
Cure	35 (92)	33 (97)
Lower urinary tract symptoms with bacteriuria	2	0
Febrile UTI	1	0
Lower urinary tract symptoms without bacteriuria	0	1
After 3 months	n = 36	n = 34
Cure	30 (83)	30 (88)
Lower urinary tract symptoms with bacteriuria	3	2
Febrile UTI	2	0
Lower urinary tract symptoms without bacteriuria	1	2
After 6 months	n = 33	n = 33
Cure	25 (76)	29 (88)
Lower urinary tract symptoms with bacteriuria	3	2
Febrile UTI	4	0
Lower urinary tract symptoms without bacteriuria	1	2
After 12 months	n = 32	n = 33
Cure	23 (72)	27 (82)
Lower urinary tract symptoms with bacteriuria	3	2
Febrile UTI	5	1
Lower urinary tract symptoms without bacteriuria	1	3

Treatment duration of febrile urinary tract infection: a pragmatic randomized, double-blind placebo-controlled non inferiority trial in men and women NieuwKoop et al. BMC medicine 2017.

- Etude randomisée, double aveugle contre placebo, non infériorité
- Adultes, hommes et femmes, infection urinaire fébrile
- 7 jours vs 14 jours
- Ciprofloxacin 500 mg ou placebo 2 fois/jour la 2ème semaine.
- Critère de jugement principal:
guérison clinique 10-18 jours après traitement
- Critères secondaires:
guérison bactériologique, 10-18 jours après traitement et guérison clinique 70–84 jours post-traitement.
- Effectif nécessaire: 200/bras, marge non infériorité de 10%

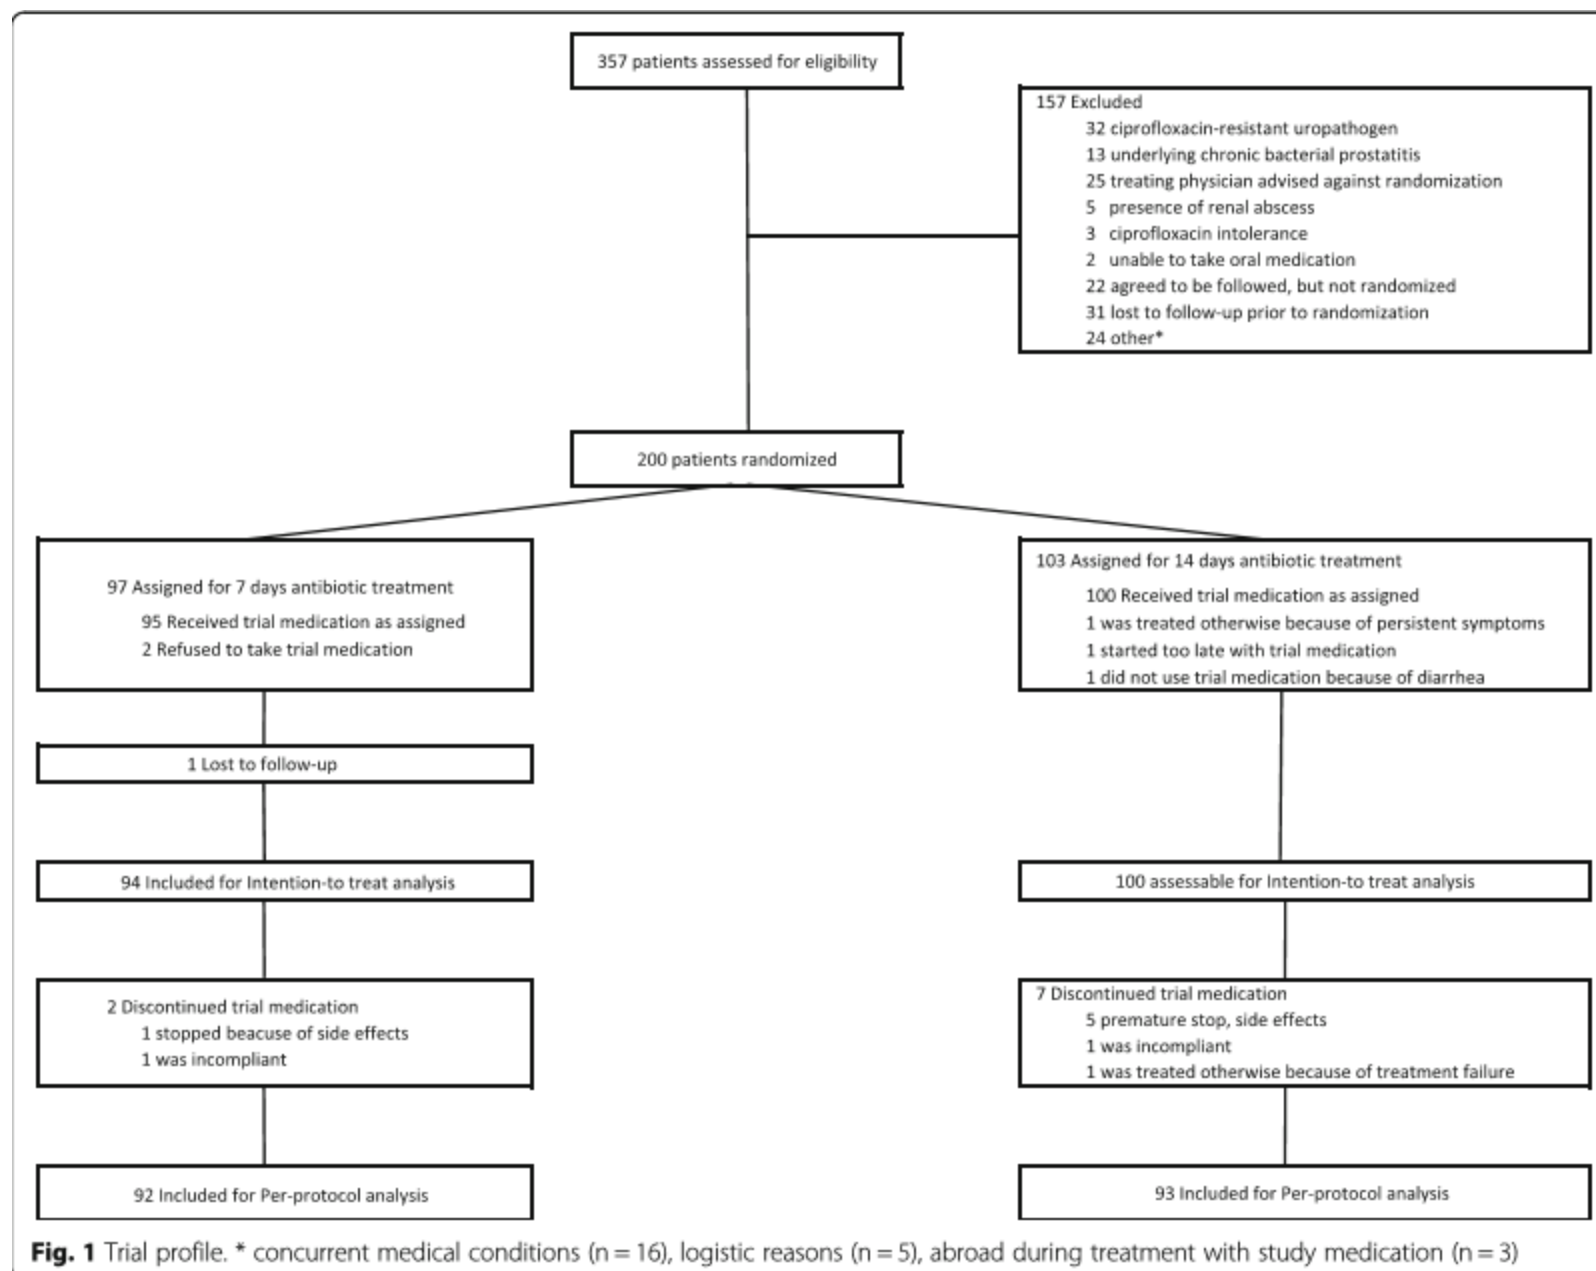

Fig. 1 Trial profile. * concurrent medical conditions (n = 16), logistic reasons (n = 5), abroad during treatment with study medication (n = 3)

Table 1 Baseline characteristics of 357 patients with febrile urinary tract infection

	Randomized (n = 200)		Not randomized (n = 157)	P value ^c
	Antibiotic treatment for 7 days (n = 97)	Antibiotic treatment for 14 days (n = 103)		
Age (years)	60 (48–72)	61 (40–73)	63 (49–75)	0.277
Male sex	44 (45%)	42 (41%)	58 (37%)	0.247
Urologic history				
Indwelling urinary catheter	3 (3%)	2 (2%)	12 (8%)	0.024
Urinary tract disorder ^a	28 (29%)	28 (27%)	52 (33%)	0.296
Recurrent UTI ^b	19 (20%)	19/100 (19%)	47/147 (32%)	0.007
Comorbidity				
Diabetes mellitus	12 (12%)	17 (17%)	25 (16%)	0.709
Malignancy	3 (3%)	5 (5%)	17 (11%)	0.012
Heart failure	12 (12%)	6 (6%)	19 (12%)	0.340

COPD	10 (10%)	11 (11%)	23 (15%)	0.236
Immunocompromised	3 (3%)	8 (8%)	14 (9%)	0.209
Signs and symptoms at presentation				
Presentation at emergency department	59 (61%)	68 (66%)	145 (92%)	<0.001
Antibiotic pretreatment	23 (24%)	29 (28%)	56 (36%)	0.048
Fever duration, hours	30 (15–48)	36 (20–60)	48 (19–96)	0.081
Dysuria	82/95 (86%)	78/102 (77%)	102/145 (70%)	0.019
Flank pain	57/96 (59%)	67/102 (66%)	91/144 (63%)	0.914
Suprapubic pain	51/96 (53%)	48/100 (48%)	72/145 (50%)	0.876
Perineal pain	4/96 (4%)	7/98 (7%)	8/140 (6%)	0.986
Shaking chills within previous 24 hours	63/97 (65%)	60/101 (59%)	102/149 (70%)	0.256
Temperature > 38 °C	66 (68%)	76 (74%)	121 (77%)	0.226
Systolic blood pressure (mm Hg, mean, SD)	132 (19)	132 (22)	129 (20)	0.324
Pulse rate (beats/minute)	93 (17)	94 (19)	97 (19)	0.360
Outpatient treatment	45 (46%)	45 (44%)	23 (15%)	<0.001
Positive urine culture	69 (71%)	68 (66%)	107 (68%)	0.944
Positive blood culture	20/88 (23%)	15/98 (15%)	45/153 (29%)	0.012
Positive urine and/or blood culture	75 (77%)	70 (68%)	118 (75%)	0.571
Initial intravenous dose(s) of antibiotics	48 (50%)	55 (53%)	133 (85%)	< 0.001

Table 3 Clinical and bacteriologic outcomes in the intention-to-treat and per-protocol population

	Randomized		Difference (90% CI)	Non-inferiority test <i>P</i> value	Not randomized population
	Antibiotic treatment for 7 days	Antibiotic treatment for 14 days			
Intention-to-treat population	(n = 94)	(n = 99)			
Short-term efficacy ^a	(n = 94)	(n = 99)			(n = 119)
Clinical cure ^b	85 (90.4%)	94 (94.9%)	−4.5% (−10.7 to 1.7)	0.072	101 (84.9%)
Bacteriologic cure ^c	86/93 (92.5%)	89/92 (96.7%)	−4.3% (−9.7 to 1.2)	0.041	94/109 (86.2%)
Cumulative efficacy ^d	(n = 94)	(n = 94)			(n = 116)
Clinical cure ^b	87 (92.6%)	86 (91.5%)	1.1% (−5.5 to 7.6)	0.005	88 (75.9%)
Per-protocol population	(n = 92)	(n = 92)			
Short-term efficacy ^a	(n = 92)	(n = 92)			NA
Clinical cure ^b	83 (90.2%)	87 (94.6%)	−4.3% (−10.8 to 2.1)	0.073	
Bacteriologic cure ^c	84/91 (92.3%)	83/86 (96.5%)	−4.2% (−9.9 to 1.4)	0.045	
Cumulative efficacy ^d	(n = 92)	(n = 87)			
Clinical cure ^b	85 (92.4%)	79 (90.8%)	1.6% (−5.3 to 8.4)	0.005	

Data presented as number (%), unless otherwise indicated. NA: not applicable

^aShort-term efficacy: endpoints assessed at 10- to 18-days post-treatment visit

^bClinical cure: being alive with absence of fever and resolution of UTI symptoms through post-treatment visit with no additional antimicrobial therapy for a relapse of UTI prescribed

^cBacteriologic cure: elimination of study entry uropathogen or pathogen growth < 10⁴ CFU/mL (women) or < 10³ CFU/mL (men) combined with disappearance of leucocyturia

^dCumulative efficacy: endpoint assessed at 70- to 84-days post-treatment visit

Fig. 2 Difference in clinical cure rates (10- to 18-days post-treatment) of febrile UTI treated for 7 days versus 14 days in specific subgroups. Stepdown treatment implies initial empiric intravenous antibiotic treatment. *UTI* urinary tract infection; *CI* confidence interval. *P* values represent test for interaction. Data presented from intention to treat analysis

Efficacy of 7 versus 14 days of antibiotic therapy in male with febrile urinary tract infection due to fluoroquinolone susceptible organisms.

PROTASHORT: a randomized clinical trial.

Randomized, double-blind, placebo-controlled, non-inferiority multicenter trial.

Day 1

Fever + UTI signs
+ Leukocyturia $\geq 10^3/\text{mL}$

Inclusion

Antibiotic therapy

- Ofloxacin 200 mg bd (IV or per os)
- Ceftriaxone 1 g od (IV or IM)
- Cefotaxime 1g td (IV or IM)

Day 3-4

- Urine culture positive
- Single uropathogen ($\geq 10^3/\text{mL}$)
- Susceptible to : 3rd generation cephalosporins, Nal acid and FQ
- No prostate abscess
- post-void residue $< 100\text{mL}$
- No fever ($< 38^\circ\text{C}$)
- Possible oral route

Yes

To all items
Randomization

7-day treatment

Day 3-4 to Day 7 oral ofloxacin
Day 8 to Day 14 placebo

14-day treatment

Day 3-4 to Day 7 oral ofloxacin
Day 8 to Day 14 oral ofloxacin

Week 6

Main assessment

Week 12

Secondary
assessment

Difference in Risk of treatment success 6 weeks after the first day of Antibiotic Therapy (Primary Outcome) in the Intention-to-Treat Analyses

Analysis	7-Day Therapy	14-Day Therapy	Risk Difference, 95%CI
	<i>No. of patients with event/total no. (%)</i>		
Intention-to-treat	(N=115)	(N=125)	
Main analysis*	64/115 (55.7)	97/125 (77.6)	-21.9 (-33.3 to -10.1)
Per-Protocol	(N=108)	(N=117)	
Main analysis*	64/112 (57.1)	94/122 (77.0)	-19.9 (-31.5 to -7.9)

* Missing outcomes for patients who were lost to follow-up were considered as failures

Predictive factors of treatment success

	No. treatment success/ TOTAL	Univariate analysis OR treatment success (95%CI)	Multivariate analysis OR treatment success (95%CI)	Multivariate analysis p-value
	161/240 (67.1)
