

Infections urinaires masculines big bang ou koik ?

13/06/2024

Matthieu Lafaurie

Unité transversale d'infectiologie U2I
SMIT

Hôpital Saint-Louis-Lariboisière, Paris

Déclaration de liens d'intérêt avec les industriels de santé en rapport avec le thème de la présentation (loi du 04/03/2002)

- Consultant ou membre d'un conseil scientifique : NON
- Conférencier ou auteur/rédacteur rémunéré d'articles ou documents : NON
- Prise en charge de frais de voyage, d'hébergement ou d'inscription à des congrès ou autres manifestations : NON
- Investigateur principal d'une recherche ou d'une étude clinique: NON

En pratique, qui fait quoi?

Mr P. 79 ans, brulures urinaires, urgenturie depuis 5 jours. Pas de fièvre.

ECBU: *E. coli* 10⁵ cfu/mL, sauvage, GB 95000/mL.

ATCD: IDM, hypercholestérolémie, PTH, Hypertrophie bénigne de prostate

Quel traitement oral, quelle durée?

- Furadantine 7 jours
- Ofloxacine 14 jours
- Fosfomycine J1-J3-J5
- Cotrimoxazole 7 jours
- Amoxicilline 10 jours
- Ciprofloxacine 21 jours
- Pivmécillinam 5 jours

En pratique, qui fait quoi?

Mr P. 79 ans, brûlures urinaires, urgenturie depuis 5 jours. Pas de fièvre.

ECBU: 10^5 E. coli, GB 125/mm³, sauvage.

ATCD: IDM, hypercholestérolémie, PTH, hypertrophie bénigne de prostate

Avant de répondre: quelle infection traite t'on?

- Ofloxacine 14 jours
- Fosfomycine J1-J3-J5
- Cotrimoxazole 7 jours
- Amoxicilline 10 jours
- Ciprofloxacine 21 jours
- Pivmécillinam 5 jours

De quelle maladie s'agit t'il?

Mr P. 79 ans, brulures urinaires, urgenturie depuis 5 jours. Pas de fièvre.

ECBU: *E. coli* 10⁵ cfu/mL, sauvage, GB 95000/mL.

ATCD: IDM, hypercholestérolémie, PTH, **hypertrophie bénigne de la prostate**

- HBP associée à une bactériurie asymptomatique
- Cystite aigue
- Prostatite aigue
- Peur de vieillir
- Urétrite

De quelle maladie s'agit t'il?

Mr P. 83 ans, brulures urinaires, urgenturie depuis 5 jours. Pas de fièvre.

ECBU: *E. coli* 10⁵ cfu/mL, sauvage, GB 95000/mL.

ATCD: IDM, hypercholestérolémie, PTH, **prostatectomie radicale pour ADK**

- Hyperactivité vésicale et bactériurie asymptomatique
- Cystite aigue
- Prostatite aigue
- Hystérie de l'homme au bout de sa vie
- Urétrite

Questions qu'on se pose encore

- ❖ Terminologie, entités cliniques : prostatite aiguë, cystite aiguë, pyélonéphrite aiguë, orchi-épididymite
- ❖ Diffusion antibiotiques dans la prostate
- ❖ Durée, doses de traitement
 - Selon diagnostic
 - Selon germes
 - Selon diffusion antibiotiques
- ❖ Bilan urologique à proposer

Groupe de travail SPILF, mise à jour recommandations infections urinaires de l'homme

W. Boutfol, F. Bruyère, Y. Caspar, V. Cattoir, A. Dinh, M. Etienne, E. Forestier, A. Hamon, M. Jonchier,

V. Jullien, M. Lafaurie (coordonnateur), A. Lefort, F. Lemaitre, H. Milacic, V. Orcel, A. Putot, C. Roubaud,

TERMINOLOGIE

❖ Cystite masculine

SPILF: entité non individualisée dans les recommandations françaises

EAU (Urologie Europe) (2024): Cystitis in men without involvement of the prostate is uncommon and should be classed as a complicated infection. Therefore, treatment with antimicrobials penetrating into the prostate tissue is needed in males with symptoms of UTI. A treatment duration of at least seven days is recommended, preferably with trimethoprim-sulphamethoxazole or a fluoroquinolone if in accordance with susceptibility testing.

❖ Infection urinaire de l'homme

SPILF: infection urinaire masculine fébrile/non fébrile

EAU: classification du National Institute of Health (NIH) distinguant la prostatite aiguë de la prostatite chronique

Nombre	Catégorie	Caractéristiques	Signes présents dans l'urine	Prémassage	Post-massage
I	Prostatite bactérienne aiguë	Symptômes aigus d'infection urinaire	Globules blancs	+/-	+
			Bactéries	+/-	+
II	Prostatite bactérienne chronique	Infection urinaire récidivante par un même microorganisme	Globules blancs	+/-	+
			Bactéries	+/-	+
III	Prostatite chronique/syndrome de douleur pelvienne chronique				
IIIa	Inflammatoires	Principalement des douleurs, des troubles mictionnels et une dysfonction sexuelle	Globules blancs	-	+
			Bactéries	-	-
IIIb	Non inflammatoire*		Globules blancs	-	-
			Bactéries	-	-
IV	Prostatite inflammatoire asymptomatique	Découverte fortuite lors de l'évaluation urologique (p. ex., biopsie de la prostate, analyse du liquide séminal) pour d'autres pathologies	Globules blancs	-	+
			Bactéries	-	-

*Précédemment appelé prostatodynie.

+/- signifie éventuellement présents; + signifie présents; - signifie absent.

Signes cliniques de prostatite aigüe

PROSTASHORT

Characteristic	7-Day Therapy (n = 115)	14-Day Therapy (n = 125)	
Clinical presentation			
Body temperature, °C, median (IQR)	38.3 (37.7–38.9)	38.2 (37.3–38.8)	
Urinary burning	92 (80.0)	104 (83.2)

Oral β -Lactam Antibiotics vs Fluoroquinolones or Trimethoprim-Sulfamethoxazole for Definitive Treatment of Enterobacterales Bacteremia From a Urine Source

Jesse D. Sutton, PharmD, MS; Vanessa W. Stevens, PhD; Nai-Chung N. Chang, PhD; Karim Khader, PhD; Tristan T. Timbrook, PharmD, MBA; Emily S. Spivak, MD, MHS

October 8, 2020

Characteristic	Patients, No. (%)	
	Fluoroquinolone or trimethoprim-sulfamethoxazole (n = 3134)	β -Lactam antibiotics (n = 955)
Age, median (IQR), y	69 (62-80)	73 (64-83)
Male	2847 (90.8)	884 (92.6)
Preexisting conditions ^a		
Combined comorbidity score, median (IQR)	1 (0-2)	1 (0-3)
Chronic kidney disease	564 (18.0)	227 (23.8)
Chronic pulmonary disease	681 (21.7)	220 (23.0)
Heart failure	480 (15.3)	170 (17.8)
Diabetes with complication	402 (12.8)	130 (13.6)
Dementia	180 (5.7)	69 (7.2)
Immunosuppression		
History of organ or stem cell transplant	72 (2.3)	22 (2.3)
Transplant antirejection medications within 90 d	64 (2.0)	20 (2.1)
High-dose corticosteroids within 30 d	39 (1.2)	17 (1.8)
Other immunosuppressive medication within 90 d	68 (2.2)	23 (2.4)
Leukopenia, leukocyte \leq 1000 cells/ μ L	5 (0.2)	1 (0.1)
Metastatic cancer	144 (4.6)	47 (4.9)
Cirrhosis	88 (2.8)	20 (2.1)
HIV	40 (1.3)	10 (1.0)

Preexisting urologic conditions ^a	FQ and cotrimoxazole	B-lactams
History of urinary tract infection	886 (28.3)	401 (42.0)
Previous antibiotics active against gram-negative organisms within 30 d	398 (12.7)	222 (23.2)
Prostate hypertrophy	887 (28.3)	324 (33.9)
Urinary retention, obstruction, or other structural urologic abnormality	723 (23.1)	288 (30.2)
Urologic procedure within 90 d before oral step-down therapy	562 (17.9)	212 (22.2)
Prostate cancer	408 (13.0)	143 (15.0)
Spinal cord injury, paraplegia, quadriplegia, or multiple sclerosis	129 (4.1)	52 (5.4)
Urinary calculi within 30 d	138 (4.4)	35 (3.7)
Acute prostatitis within 30 d	15 (0.5)	7 (0.7)
Enterobacteriales isolated from bloodstream		
<i>Escherichia coli</i>	2254 (71.9)	711 (74.5)
<i>Proteus mirabilis</i>	189 (6.0)	116 (12.1)
<i>Klebsiella pneumoniae</i>	589 (18.8)	104 (10.9)
<i>Klebsiella oxytoca</i>	75 (2.4)	14 (1.5)
Other or unspecified <i>Klebsiella</i> spp	14 (0.4)	5 (0.5)
Other or unspecified <i>Proteus</i> spp	13 (0.4)	5 (0.5)

Acute characteristics ^b	FQ and cotrimoxazole	B-lactams
Time from hospitalization to bacteremia \geq 48 h	159 (5.1)	28 (2.9)
Antibiotic initiation		
Intensive care unit	543 (17.3)	165 (17.3)
Vasopressors	122 (3.9)	30 (3.1)
Serum leukocyte \geq 12 000 cells/ μ L	2145 (68.4)	615 (64.4)
Temperature \geq 38.3 °C	1799 (57.4)	542 (56.8)
Oral step-down therapy		
Intensive care unit	84 (2.7)	22 (2.3)
Serum leukocyte \geq 12 000 cells/ μ L	480 (15.3)	130 (13.6)
Temperature \geq 38.3 °C	81 (2.6)	15 (1.6)
Weight, median (IQR), kg	85 (73-100)	86 (74-102)
Creatinine clearance while receiving oral step-down therapy, median (IQR), mL/min ^c	62 (44-81)	58 (41-76)
Treatment characteristics		
Time to in vitro active antibiotics, median (IQR), h	12 (6-20)	13 (7-21)
1st day of oral antibiotics alone, median (IQR), d	4 (4-5)	5 (4-5)
Day 2	138 (4.4)	32 (3.4)
Day 3	474 (15.1)	121 (12.7)
Day 4	1027 (32.8)	303 (31.7)
Day 5	893 (28.5)	302 (31.6)
Day 6	602 (19.2)	197 (20.6)
Oral antibiotic with in vitro activity	3077 (98.2)	937 (98.1)
Unknown	34 (1.1)	12 (1.3)
Antibiotic duration, median (IQR), d		
Total	14 (12-16)	14 (12-16)
Oral	10 (9-13)	10 (8-12)

Outcome	Patients, No. (%)		aRD, % (95% CI) ^a	aRR (95% CI) ^a
	Fluoroquinolones or trimethoprim-sulfamethoxazole (n = 3134)	β-Lactam antibiotics (n = 955)		
30-d Mortality and recurrent bacteremia	94 (3.0)	42 (4.4)	0.99 (-0.42 to 2.40)	1.31 (0.87 to 1.95)
Mortality	82 (2.6)	29 (3.0)	0.06 (-1.13 to 1.26)	1.02 (0.67 to 1.56)
Recurrent bacteremia	12 (0.4)	14 (1.5)	1.03 (0.24 to 1.82)	3.43 (0.42 to 27.90)
90-d Mortality and recurrent bacteremia	238 (7.6)	96 (10.1)	1.81 (-0.24 to 3.87)	1.23 (0.96 to 1.56)
Mortality	208 (6.6)	75 (7.9)	0.68 (-1.16 to 2.52)	1.10 (0.85 to 1.42)
Recurrent bacteremia	34 (1.1)	25 (2.6)	1.38 (0.30 to 2.47)	2.15 (0.92 to 5.01)
Repeated hospitalization with UTI				
At 30 d	22 (0.7)	14 (1.5)	0.81 (-0.06 to 1.67)	2.08 (0.72 to 5.99)
At 90 d	46 (1.5)	29 (3.0)	1.46 (0.28 to 2.64)	1.94 (0.97 to 3.85)

Abbreviation: aRD, adjusted risk difference; aRR, adjusted relative risk; UTI, urinary tract infection.

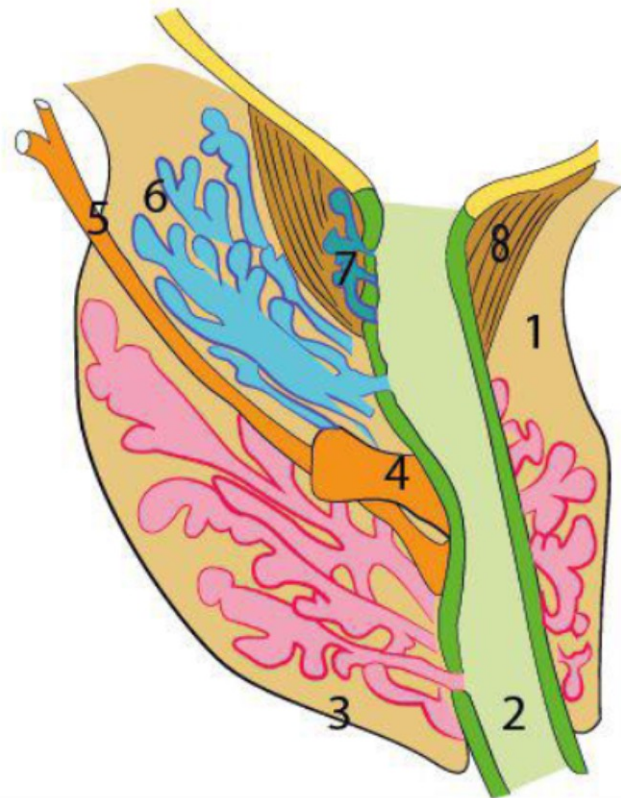

Drug	Patients, No. (%)	30-d Recurrent bacteremia, No./total No. (%)	30-d Mortality, No./total No. (%)	Dose, mg/dose ^a	Doses per day, No.	Patients, No./total No. (%)
β-Lactam antibiotics (n = 955)						
Amoxicillin-clavulanate potassium	251 (26.3)	4/251 (1.6)	13/251 (5.2)	875-125	2	161/251 (64.1)

Infection systématique de la prostate si bactéries dans les urines?

- ❖ Je ne crois vraiment pas
- ❖ Risque plus élevé après RTUP? (rupture barrière urothéliale)

- ❖ Pour simplifier:
 - **Infection tissulaire=fièvre**=prostatite aiguë (ou PNA)
 - **Pas d'infection tissulaire=pas de fièvre**=infection vésicale=cystite
 - Pas de fièvre mais bactériémie= prostatite aiguë/PNA?

- ❖ Intérêt de cette distinction: durée (nature) du traitement

Diffusion des antibiotiques dans la prostate

Tissue concentrations: do we ever learn?

Mouton *et al.* JAC 2008.

- Attention à l'interprétation de la concentration tissulaire et lien avec l'activité antibiotique
- Concentration tissulaire = généralement concentration broyat tissulaire
- Hors: plusieurs compartiments tissulaires: intracellulaire (80% du volume), organites intracellulaires, extracellulaire: liquide interstitiel (16% du volume) et intravasculaire (4%).
- Diffusion des antibiotiques variable selon le compartiment
- Bactéries généralement dans l'espace extracellulaire
- Compartiment extracellulaire: B-lactamines et aminosides. Donc dilution de la concentration si broyat et sous-estimation: multiplier par 5 la concentration pour avoir la concentration réelle dans l'espace extra-cellulaire.
- Résultat inverse si concentration intracellulaire (FQ, macrolides) et surestimation de la concentration.

Diffusion des antibiotiques dans la prostate

- Pièges pour interprétation PK sérum/tissu
- Les ratios de concentration tissu/plasma change avec le temps en raison
 - du décalage entre les cinétiques plasmatiques et tissulaires
 - du décalage de l'équilibre de concentration selon les compartiments
- Donc attention au moment mesure concentration tissulaire (souvent une seule mesure), intérêt plusieurs mesures (mais pas possible pour un seul individu).
- Lien concentration un seul point et CMI: non sens

TRAITEMENT

SPILF

La notion de fièvre disparaît pour le choix et la durée des antibiotiques

❖ *Apyrexie et infection « bien » tolérée* : ttt différé selon documentation microbiologique si possible

❖ Durée :

- 14 j si fluoroquinolone, triméthoprime-sulfaméthoxazole, β -lactamines injectables

- 21 j pour les autres molécules **OU** si uropathie sous jacente non corrigée (= troubles mictionnels préexistants, lithiase...)

En pratique, qui fait quoi?

Mr P. 83 ans, brûlures urinaires, urgenturie depuis 5 jours. Pas de fièvre. ECBU: *E. coli* 10^5 cfu/mL, sauvage, GB 95000/mL.

ATCD: IDM, hypercholestérolémie, PTH, HBP

Quel traitement, quelle durée?

- Furandantine 7 jours
- Ofloxacine 14 jours
- Fosfomycine: J1-J3-J5
- Cotrimoxazole 7 jours
- Amoxicilline 10 jours
- Ciprofloxacine: 21 jours
- Pivmécillinam: 5 jours

Traitement: Cystite de l'homme

- Hommes souvent inclus dans les études de traitement des cystites compliquées, mais de façon variable et minoritaire (jusqu'à 10%), résultats de ce sous-groupe non donnés.
- Données spécifiques chez l'homme, essentiellement cohortes rétrospectives
 - pivmécillinam
 - triméthoprim
 - cotrimoxazole
 - nitrofurantoin
 - fosfomycine
- Doses et durées variables mais ≤ 7 jours (5-7 jours)

Recommandations internationales, cystite de l'homme

❖ Pays bas

- 1er choix : Nitrofurantoïne, 7 jours, 100 mg x2/j ou 50 mg x4/j.
- 2ème choix : Triméthoprimine, 7 jours, 300 mg/j.

❖ GB

- Triméthoprimine: 7 jours, 200 mg x2/j
- Nitrofurantoïne: 7 jours (si DFG estimé ≥ 45 mL/min): 100 mg x2/j (ou 50 mg x4/j)

Recommandations internationales, cystite de l'homme

❖ Suède

On cherche à obtenir une forte concentration d'antibiotiques dans les urines

- Nitrofurantoïne
- Pivmécillinam

Durée recommandée du traitement : 7 jours

Effect of 7 vs 14 Days of Antibiotic Therapy on Resolution of Symptoms Among Afebrile Men With Urinary Tract Infection (Drenkonja *et al.* JAMA 07/2021)

- Etude **randomisée en double aveugle, contre placebo**
- 2 centres médicaux (Minnesota et Texas)
- **Patients:** hommes, > 18 ans, ttt prescrit pour 7 à 14 jours par Cipro ou cotrimoxazole pour infection urinaire non febrile, en ambulatoire, par leur médecin.
- Et au moins un signe parmi: dysuria, pollakiurie, urgenturie, hématurie, douleur angle costo-vertébral ou périnée ou flanc ou sus pubienne.
- **Non inclusion:** infection urinaire dans les 14 jours précédents, $t^{\circ} > 38^{\circ} \text{C}$, germe urinaire résistant au ttt prescrit.
- **ECBU pas nécessaire**
- Traitement prescrit pendant 7 jours
- Tirage au sort pour traitement à partir de J8
 - soit continuer le même ttt (mais cp différents), pdt 7 jours
 - soit prendre un placebo pdt 7 jours

Suivi téléphonique: J14, puis +7, +14 et +28.

Table 1. Baseline Demographics and Comorbid Conditions^a

Variable	7-Day antimicrobial + 7-day placebo group (n = 136) ^{b,c}	14-Day antimicrobial group (n = 136) ^c
Age, median (IQR), y	70 (62-73)	70 (62-75)
Race ^{d,e}	(n = 135)	(n = 135)

<i>Staphylococcus aureus</i>	1 (1)	2 (3)
<i>Aerococcus urinae</i>	1 (1)	1 (1)
Gram-positive bacilli, not further identified	1 (1)	1 (1)
<i>Pseudomonas aeruginosa</i>	0	2 (3)
<i>Salmonella</i> species	0	1 (1)

ECBU positif: n=145, 53%; dont 14 à SCN...

Table 3. Primary and Secondary Outcomes

Characteristic	No./total No. (%)		
Resolution of UTI symptoms 14 days after stopping active antimicrobials	7-Day antimicrobial + 7-day placebo group	14-Day antimicrobial group	Absolute difference, % (1-sided 97.5% CI)^a
As-treated population (primary analysis)	122/131 (93.1)	111/123 (90.2)	2.9 (-5.2 to ∞)
As-randomized population	125/136 (91.9)	123/136 (90.4)	1.5 (-5.8 to ∞)
Recurrence of UTI symptoms within 28 days of stopping study medication (secondary outcome)	7-Day antimicrobial + 7-day placebo group	14-Day antimicrobial group	Absolute difference, % (2-sided 95% CI)^b
As-treated population	13/131 (9.9)	15/123 (12.9)	-3.0 (-10.8 to 6.2)
As-randomized population	14/136 (10.3)	23/136 (16.9)	-6.6 (-15.5 to 2.2)

Abbreviation: UTI, urinary tract infection.

^a The primary analysis used a 1-sided 97.5% CI for noninferiority, which was established if the lower bound of the 1-sided 97.5% CI did not cross the noninferiority margin of -10% difference in symptom resolution.

^b The secondary outcome was analyzed using a 2-tailed superiority hypothesis test of differences in proportions (2-sample test for equality of proportions with continuity correction) with $\alpha = .05$ and with 2-sided 95% CIs.

Among afebrile men **with suspected UTI**, treatment with ciprofloxacin or trimethoprim/sulfamethoxazole for 7 days was non inferior to 14 days of treatment with regard to resolution of UTI symptoms by 14 days after antibiotic therapy.

Acute cystitis in men– a nationwide study from primary care: antibiotic prescriptions, risk factors, and complications Håkon Sætre *et al.* BJGP Open 2024

- ❖ 2012-2019, Norvège
- ❖ Données médecine générale
 - registre national remboursement assurance maladie (KUHR))
 - prescriptions médicaments nationales (NorPD)
 - 3 jours de délai entre diagnostic et prescription antibiotique
- ❖ Hommes > 18 ans
- ❖ Diagnostic de cystite (ICPC-2), 1^{er} épisode
- ❖ Prescription antibiotique « compatible » traitement d'une cystite
 - spectre étroit: pivmécillinam, triméthoprime, nitrofurantoine
 - spectre large: amoxicilline, amoxicilline-a. clavulanique, triméthoprime–sulfaméthoxazole, ciprofloxacin, ofloxacin, moxifloxacin, fosfomycine, azithromycine, doxycycline et céfalexine.
- ❖ Si antibiotique relevant dans les 90 jours: exclusion

Treatment duration of febrile urinary tract infection: a pragmatic randomized, double-blind placebo-controlled non inferiority trial in men and women Nieuwkoop *et al.* BMC medicine 2017.

- ❖ Etude randomisée, double aveugle contre placebo, non infériorité
- ❖ Adultes, hommes et femmes, infection urinaire fébrile
- ❖ 7 jours vs 14 jours
- ❖ Ciprofloxacine 500 mg ou placebo 2 fois/jour la 2ème semaine.
- ❖ Critère de jugement principal:

guérison clinique 10-18 jours après traitement

- ❖ Critères secondaires:

guérison bactériologique, 10-18 jours après traitement et guérison clinique 70–84 jours post-traitement.

- ❖ Effectif nécessaire: 200/bras, marge non infériorité de 10%

Table 1 Baseline characteristics of 357 patients with febrile urinary tract infection

Table 3 Clinical and bacteriologic outcomes in the intention-to-treat and per-protocol population

	Randomized		Difference (90% CI)	Non-inferiority test <i>P</i> value	Not randomized population
	Antibiotic treatment for 7 days	Antibiotic treatment for 14 days			
Intention-to-treat population	(n = 94)	(n = 99)			
Short-term efficacy ^a	(n = 94)	(n = 99)			(n = 119)
Clinical cure ^b	85 (90.4%)	94 (94.9%)	-4.5% (-10.7 to 1.7)	0.072	101 (84.9%)
Bacteriologic cure ^c	86/93 (92.5%)	89/92 (96.7%)	-4.3% (-9.7 to 1.2)	0.041	94/109 (86.2%)
Cumulative efficacy ^d	(n = 94)	(n = 94)			(n = 116)
Clinical cure ^b	87 (92.6%)	86 (91.5%)	1.1% (-5.5 to 7.6)	0.005	88 (75.9%)
Per-protocol population	(n = 92)	(n = 92)			
Short-term efficacy ^a	(n = 92)	(n = 92)			NA
Clinical cure ^b	83 (90.2%)	87 (94.6%)	-4.3% (-10.8 to 2.1)	0.073	
Bacteriologic cure ^c	84/91 (92.3%)	83/86 (96.5%)	-4.2% (-9.9 to 1.4)	0.045	
Cumulative efficacy ^d	(n = 92)	(n = 87)			
Clinical cure ^b	85 (92.4%)	79 (90.8%)	1.6% (-5.3 to 8.4)	0.005	

Data presented as number (%), unless otherwise indicated. NA: not applicable

^aShort-term efficacy: endpoints assessed at 10- to 18-days post-treatment visit

^bClinical cure: being alive with absence of fever and resolution of UTI symptoms through post-treatment visit with no additional antimicrobial therapy for a relapse of UTI prescribed

^cBacteriologic cure: elimination of study entry uropathogen or pathogen growth < 10⁴ CFU/mL (women) or < 10³ CFU/mL (men) combined with disappearance of leucocyturia

^dCumulative efficacy: endpoint assessed at 70- to 84-days post-treatment visit

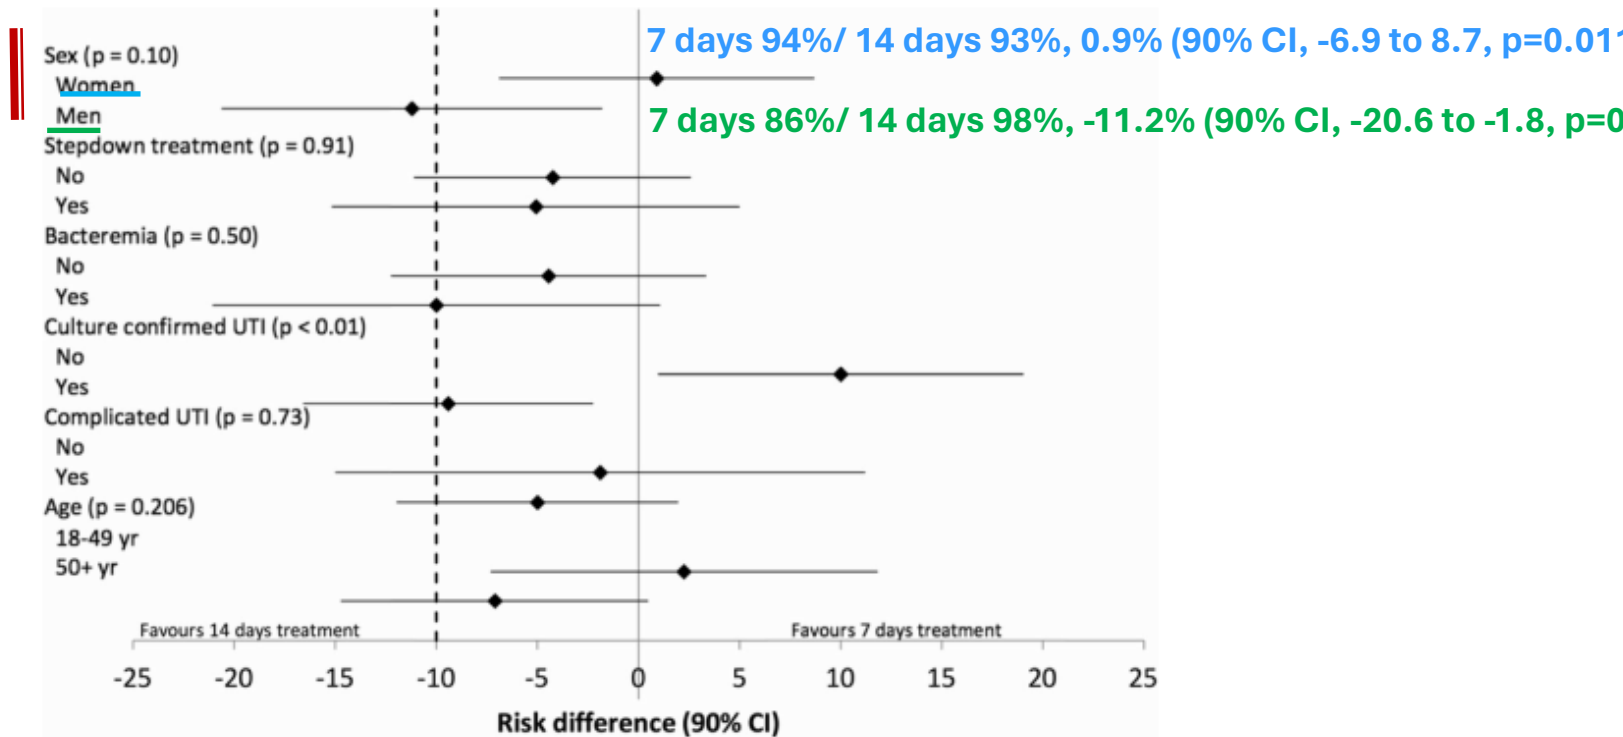

Fig. 2 Difference in clinical cure rates (10- to 18-days post-treatment) of febrile UTI treated for 7 days versus 14 days in specific subgroups. Stepdown treatment implies initial empiric intravenous antibiotic treatment. *UTI* urinary tract infection; *CI* confidence interval. *P* values represent test for interaction. Data presented from intention to treat analysis

Antimicrobial for 7 or 14 Days for Febrile Urinary Tract Infection in Men: A Multicenter Noninferiority Double-Blind, Placebo-Controlled, Randomized Clinical Trial

Clin Infect Dis. 2023

Endpoints

- ❖ **Primary endpoint:** treatment success, defined as a negative urine culture, the absence of fever and of subsequent antibiotic treatment between the end of treatment and 6 weeks after day 1.
- ❖ **Secondary endpoints:** recurrent urinary tract infection within weeks 6 and 12 after day 1, rectal carriage of antimicrobial-resistant *Enterobacterales* and drug-related events.

Table 2. Difference in Risk of Treatment Success 6 Weeks After the First Day of Antibiotic Therapy (Primary Outcome) in the Intention-to-Treat and Per-Protocol Analyses

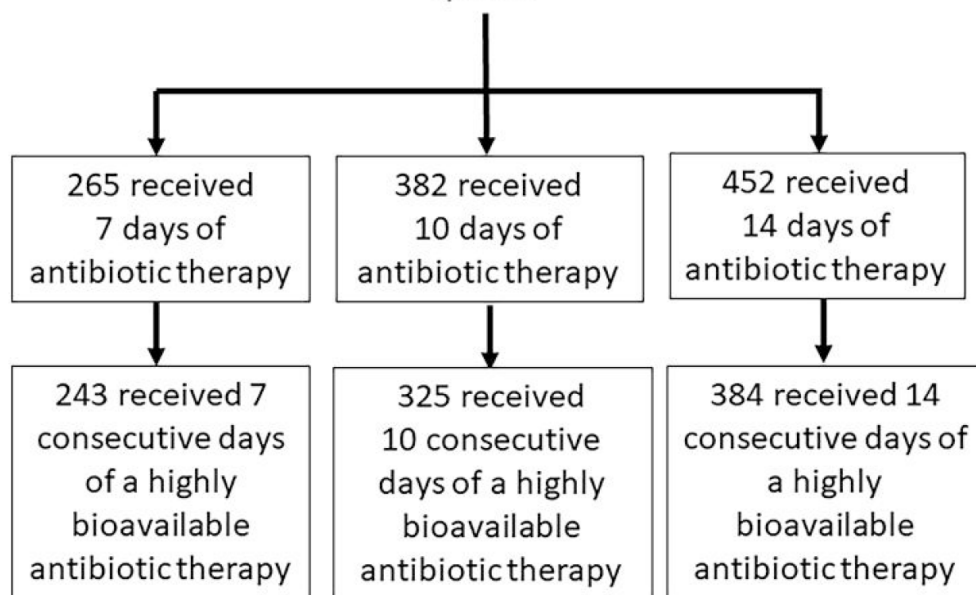

Analysis	7-Day Therapy No. of Participants With Event/Total No. (%)	14-Day Therapy No. of Participants With Event/Total No. (%)	<i>P</i> Value	Risk Difference (95% CI)
Intention-to-treat	(n = 115)	(n = 125)		
Main analysis ^a	64 (55.7)	97 (77.6)		-21.9 (-33.3 to -10.1)
Microbiological success ^b	91 (79.1)	117 (93.6)	.001	-14.5 (-23.5 to -6.0)
Clinical success ^c	110 (95.6)	125 (100)	.02	-4.3 (-9.8 to -1.3)
No new antibiotic after the end of treatment	93 (80.9)	116 (92.8)	.007	-11.9 (-20.9 to -3.5)
Per-protocol	(n = 108)	(n = 117)		...
Main analysis ^a	64 (59.3)	96 (82.1)		-22.8 (-34.2 to -11.0) ^d

Table 3. Predictive Factors of Treatment Success

Factor	No. of Treatment Success/Total	Univariate Analysis OR for Treatment Success (95% CI)	Multivariable Analysis

Defining the optimal duration of therapy for hospitalized patients with complicated urinary tract infections and associated bacteremia. Mc Ateer *et al.* CID 2023

Patients ≥ 18 years of age with gram-negative bloodstream infections during the 2019 calendar year across 24 hospitals meeting eligibility criteria for cUTI* with bacteremia due to the same bacterial species

***Complicated UTI (cUTI) defined as growth of at least 1,000 CFU/mL of a gram-negative organism in the urine of an adult patient (same bacterial species as in the blood culture) with any of the following conditions:**

- Male sex OR
- UTI associated with one or more of the following underlying conditions at time of diagnosis:
 - Prostate hypertrophy
 - Prostate cancer
 - Nephrolithiasis
 - Intermittent or indwelling urinary catheter
 - Urethral stent
 - Nephrostomy tube
 - Intestinal conduit
 - Renal transplant

Table 2. Baseline Characteristics of 834 Adults With Complicated Urinary Tract Infections With Associated Bloodstream Infections, Before and After Inverse Probability of Treatment Weighting, Comparing 10 Days With 14 Days of Antibiotic Therapy

Variable	Full Cohort			Inverse Probability Weighted Cohort		
	10 Days (n = 382; 46%)	14 Days (n = 452; 54%)	P	10 Days (%)	14 Days (%)	Standardized Mean Difference
Age in years, median (IQR)	70 (60–80)	68 (56–77)	.04
Age ≥65 years	246 (64%)	263 (58%)	.08	64.4	64.9	0.011
Male sex, n (%)	244 (64%)	293 (65%)	.83	63.9	64.5	0.013

Nephrostomy tube	19 (5%)	36 (8%)	.11
Ureteral stent	9 (2.4%)	6 (1.3%)	.39
Ileostomy	5 (1.3%)	7 (1.5%)	.99
Suprapubic catheter	3 (0.8%)	16 (3.5%)	.015
Intermittent urinary catheterization	19 (5%)	25 (5.5%)	.84
Foley catheter	55 (14%)	56 (12%)	.45
Prostate cancer	12 (3.1%)	18 (4%)	.64
Nephrolithiasis	70 (18%)	96 (21%)	.34
Active empiric therapy, n (%)	348 (91%)	407 (90%)	.61	90	90	0.008
<i>Pseudomonas aeruginosa</i> , n (%)	20 (5.2%)	34 (7.5%)	.23	5.2	5.4	0.006
ESBL-producing Enterobacteriales, n (%)	51 (13%)	55 (12%)	.68	13.4	14.0	0.019
Carbapenem-resistant organism, n (%)	4 (1%)	2 (0.4%)	.54
Source control by end of antibiotic therapy, n (%)	65 (17%)	50 (11%)	.03	11.3	11.5	0.009

	Durée Antibiothérapie 10 jours	Durée Antibiothérapie 14 jours	p
Nombre de patients	382	452	
Rechute* à J30	20/382 (5,2%)	28/452 (6,2%)	OR 0,99 (0,52-1,87) p=0,99
Rechute à germe résistant**	2/20 (10%)	10/28 (35,7%)	p=0,10

*Rechute clinique et ECBU positif à la même espèce bactérienne que l'uroculture initiale,

** Souche résistante à l'antibiotique utilisé (élévation de la CMI \geq 4x CMI initiale).

7 jours vs 14 jours: risque rechute 2,5 fois plus élevé avec 7 j (OR ajusté 2,54 ; IC95% 1,40-4,60)
7 jours vs 14 jours et B-lactamine IV et/ou FQ ou cotrimoxazole (OR ajusté 0,76 ; IC95% 0,38-1,5)

Au total

- ❖ Infections urinaires classées en fébriles/bactériémiantes/non fébriles
- ❖ Infection non fébrile, non bactériémiante= cystite
- ❖ Cystite: durée de traitement de 7 jours maximum/antibiotiques à spectre étroit et pas de nécessité de diffusion intraprostatique
- ❖ Prostatite aiguë: traitement de 7 jours probablement insuffisant/durée 14 jours (10 jours dans certaines situations?)
